The 65XE/130XE/800XE/XEGS contain a small additional LSI called FREDDIE, a RAM address multiplexer. According to James Bradford, "FREDDIE is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDIE also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDIE but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDIE, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDIE for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDIE does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDIE) and an extra 8 RAM chips."

And more recently James Bradford has written:
FREDDIE is just a memory decoder and timer. It replaces several chips in the 800XL. The small chip near FREDDIE does all the bank selection. CO25953. One line from FREDDIE, Ras (or is it cas?) goes to this chip, Halt and the bank /processor select lines go into this same chip and ras (cas?) comes out. A pin for each bank. If I remember correctly, refresh also goes into this small chip. It would be quite easy to make an 800XL work just like a 130XE with this chip since Ras (Cas?) is required by ALL dynamic RAM.

======
Technical data sheets and schematics for the ANTIC, GTIA, and POKEY chips are available on Curt Vendel's web site, thanks to permission from Hasbro's Atari Interactive Division's release of this data. See the TIFF scans:
http://www.atari-history.com/articles.html
Keith Howell has converted the hi-res TIFFs into clean HTML:

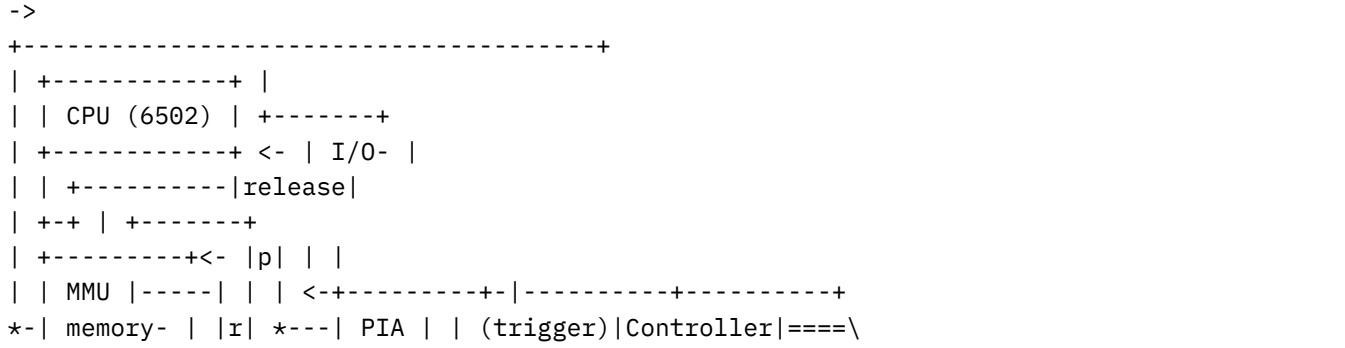
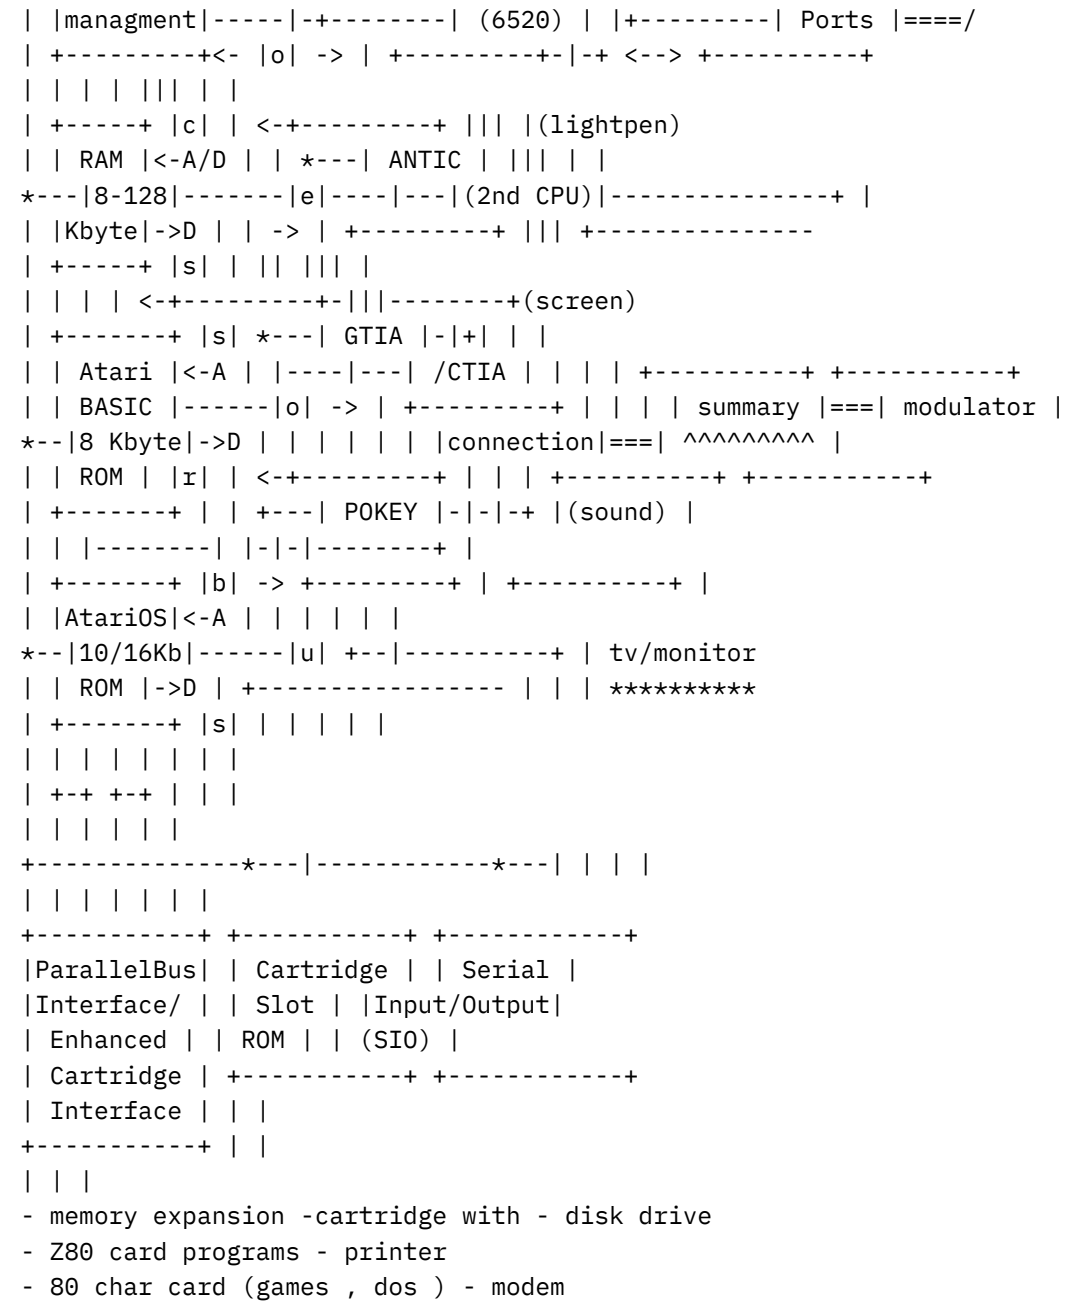
Subject: 1.12) What is the internal layout of the 8-bit Atari?

ASCII art by Thomas Havemeister.





- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard
130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502B, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE/many PAL 65XE only

* Some late XE's use a 68B21 for PIA; PIA is 6520/6520A on all others

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan), Jerry Jessop, Scott Emmons

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

Subject: 1.13) What issues surround NTSC vs PAL versions of the 8-bit Atari?

Contributors to this section:
Wayne Booth, Graham Thornton, Brent Buescher Jr., Thomas Richter, Jindroush

Some quick definitions first:

NTSC standard: Abbreviation for "National Television Standards Committee"
TV signal standard used in North America, Central America, a number of South American countries, and some Asian countries, including Japan.
525 lines per frame
60 half-frames per second (interlaced) = 60 Hz
Complete frame refreshed 30 times per second

PAL: Acronym for "phase alternation by line"
TV signal standard used in the United Kingdom, much of the rest of western Europe, several South American countries, some Middle East and Asian countries, several African countries, Australia, New Zealand, and other Pacific island countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

PAL-M: A modified version of PAL, used in Brazil.

SECAM: Acronym for "systeme electronique couleur avec memoire"
TV signal standard used in France, eastern European countries, the former USSR, and some African countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

Now then, how do the differences among 8-bit Atari computers designed for the different world television signal standards affect users trying to use software written elsewhere in the world?

The 50Hz vertical refresh frequency of PAL machines translates into more vertical blank interrupt (VBI) time for demos and other computation-intensive graphics software, when compared to the time available for VBIs on NTSC machines with the faster 60Hz refresh frequency. So PAL demos and games that won't work on NTSC machines are usually returning from a VBI too late. Some also attempt to use more vertical resolution ("longer" display lists) than an NTSC display can handle.

Note that the reverse is also true. Software using VBIs will run more slowly on a PAL Atari than on an NTSC Atari.

Replacing the NTSC ANTIC chip in an NTSC Atari with a PAL ANTIC changes the screen refresh rate to 50Hz, allowing most of the PAL-only European software to run on a North American NTSC Atari. However, make sure your display device can support a 50Hz PAL signal first! North American Atari users can also obtain and use real European PAL Atari machines, with the same caveat concerning the display device.

Bottom line:
Software written for NTSC machines (North America) will (almost) always work on PAL machines (Europe), but software designed on PAL machines won't necessarily work on NTSC machines.

Jindroush contributes: (2/26/02)
Could there be a program which runs on NTSC Atari and not on PAL Atari? Yes, if it uses some precise timing copy protection (probably based on vblank timing). Examples of these are Transylvania and The Quest by Penguin Software.

Thomas Richter mentions another NTSC vs PAL issue:
Another point is that the popular pseudo-colors used in the ANTIC-F (Graphics 8) mode are not colorful at all when displayed on a PAL TV, because of differences in the color encoding for the TV. The schematics of the XL computers include however a hack how to change the PAL version to the NTSC version (the PAL versions include two crystals, one with 5/4th of the frequency of the other. One is used for the system clock, the other for the color clock), but I never dared to apply it.

And on 10/16/03 Thomas Richter answered a related question this way:
>> Note that it's typically not too hard to get an NTSC Atari to run in PAL
>> by just swapping out the ANTIC chip.
>>
>> Unfortunately, some demos actually check the OS ROM for a particular
>> value to see if it's a PAL machine or not, and then refuse to run if
>> they are. *grumble* I'd rather have a warning than a refusal. :^P

> As far as I am aware, the only value to tell a PAL from a NTSC machine is in
> GTIA. Maybe swap that one as well and see what you get

Absolutey correct, GTIA keeps the PAL/NTSC register and the Os rom reads it from there. However, besides the GTIA PAL and NTSC machines differ in other

aspects. For example, on PAL machines an additional oscillator of 5/4 of the main frequency is present to generate the color frequencies needed to drive GTIA. There is no such circuit in NTSC Ataris. Besides, this factor of 5/4 is also the reason why you don't get "artifacted colors" on PAL machines (or, at least, not very good ones.)

Subject: 1.14) What are the pinouts for the various ports on the Atari?

Controller Port (4 on 400/800, 2 on all others):
1 2 3 4 5
o o o o o

Subject: 2.1) What video display devices can I use with my Atari?

Contributors to channel output variations list:
Jon Levy, Rene de Bie, Sysop Fox-1

Most 8-bit Atari computers put out video signals in two places:

1) Radio-Frequency (RF) signal, either one VHF channel, or two VHF channels selectable by a switch on the computer. Variations depend primarily on the part of the world that the particular version of the computer was desgined for.

Most North American computers: VHF channels 2-3 switch-selectable.
channels 3-4 switch selectable also reported
European computers: VHF channels 3-4 switch-selectable,
or no switch (what channel?) both reported
UK computers: VHF channel 36, no switch,
or channels 38-39 switch selectable both reported
Australian computers: VHF channel 1 (400/800: channels 1-2 selectable)

Any further clarifications would be appreciated!

Accessories needed:
a) RF Cable. (RF=radio frequency--video and audio signals in the same line)
On the 400/800 models, the RF Cable does not detach from the computer.
The output end of the cable is an RCA male connector.

b) TV Switch Box. Includes an RCA female connector for RF signal input from the Atari, input connector(s) for your TV attenna and/or cable TV company, and 75- and/or 300-ohm VHF output connector(s) for connection to the VHF input on the television. (Radio Shack carries a suitable TV Switch Box.)

2) A proprietary 5-pin DIN Monitor Jack, which includes two video signals:
a) Composite video.
b) Y/C Video, also known as S-Video:
separate composite luminance (Y) and chrominance (C) signals.

Exceptions among the computer models:
-the 400 and North American 600XL lack the Monitor Jack.
-the XE Game System includes an RCA-style jack in place of the Monitor Jack, providing a plain composite video signal only.
-the Monitor Jack on the 600XL, 800XL(most) and 1200XL lacks the separate chrominance signal. (But it exists internally, and can be restored to the monitor jack via hardware modification.)

The pinout for the Atari Monitor Jack is in the pinouts sections of this FAQ list.

The typical Atari Monitor Cable includes the male 5-pin DIN connector on one end, and two RCA male connectors on the other end. One of the RCA connectors will carry the monophonic sound signal, and the other will carry the composite video signal. Color composite monitors were common in the mid-80's, but these days many televisions have an RCA female composite video input connector which works fine with the Atari.

You may find an Atari Monitor Cable where the video signal carried on the second RCA connector is not the composite video signal, but the composite luminance signal. These cables are for use with monochrome composite video monitors (usually green or amber).

The ideal Atari Monitor Cable includes 3 RCA male connectors on the output end, carrying the sound signal, the composite luminance signal, and the composite chrominance signal. Only the best composite monitors include separate chrominance and luminance inputs. Commodore produced many fine monitors of this type, popular with Atari users.

Lonnie McClure provides this information on suitable Commodore monitors:
1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

The separate composite chrominance and luminance signals that the Atari puts out comprise what the world has since come to call Y/C video or S-video. S-video connectors are normally Mini4. It is possible to build a cable, or purchase several adapters, that can allow you to utilize the separate Y/C signals generated by the Atari with a television (or other display device) that provides a standard S-video Mini4 input jack. This is the ultimate display option for the 8-bit Atari. Clarence Dyson has a nice page about such a project at http://www.wolfpup.net/atari/svideo.html .

Adapters also exist that will take in composite video or s-video, and output a conversion of the signal as a standard VGA video signal. These are often known as a "VGA converter" or "Scan doubler" or "Up-converter." With such a device, the 8-bit Atari can be used with a standard PC VGA monitor. One such adapter is the Cheese Video Box from AV Toolbox, http://www.avtoolbox.com. AV Toolbox produces several other similar devices. An earlier popular adapter was the JAM!! from AIMS Lab.

SCART - an acronym for Syndicat des Constructeurs d'Appareils Radiorecepteurs et Televiseurs - is a 21-pin universal connecting cable/socket system used for audio/video components in Europe. The cables transmit RGB, composite video, S-Video, mono and stereo sound. SCART, which is also known as PERITEL, EURO AV BUS and EUROCONECTOR, is common throughout Europe, particularly in France, England, Germany, Switzerland, and Scandinavia. SCART is also very popular in the Russian Audio Video market. It is possible to interface the Atari's composite video signal, along with the audio signal, through a SCART connector, though there have been few reports of people actually doing this.

Keith Howell has a nice page on some of these topics:
http://www.howell1964.freeserve.co.uk/Atari/800XL/Atari_800XL_Video.htm

December 2003--More Than Games announced "A8 A/V BOB", an audio/video
breakout box featuring phono connectors for composite video, chroma,
luminance, and mono audio; it also features an s-video jack providing chroma
and luminance. http://www.a8maestro.com/sites/mtgcat/mtgcat.htm

---

Subject: 3.1) What are the Atari 410, 1010, XC11, and XC12 Program Recorders?

The Atari Program Recorders provide storage and retrieval of programs
and data on cassette tape. In addition to the digital track that stores
computer data, a second audio track is provided to play music or voice
as the program runs.

Data transmission rate: 600 bits per second.
Data storate capacity: 100,000 bytes per 60-minute cassette.
Track configuration: 4 track, 2 channel (digital data and audio track)

410 Program Recorder
- early Japan version had a carrying handle
- most versions made in Hong Kong
- 410a--Taiwan version
- built-in SIO cable - must end SIO daisy chain
- power - plugs directly into wall (most versions)
- "410P" version (rare). Karl Heller writes:
"It came in the white 410 box with an Atari yellow/orange paper slip
stating which power supply to use with it."

1010 Program Recorder
- Chelco version has Stop/Eject, then Pause buttons
- Sanyo version has Pause, then Stop/Eject buttons
- two SIO ports

XC11 Program Recorder
- has a built-in SIO cable and one SIO port

XC12 Program Recorder
- built-in SIO cable - must end SIO daisy chain

Upgrades for the Atari Program Recorders
==
Andreas Magenheimer writes: (2004.05.24)
- turbo 6000: a turbo tape enhancement built in the former GDR (german
democratic republic); it worked with 6000 Baud and required special
loading/saving programs that were available as disk-files and also as
cartridges;
Information on the Turbo 6000 Baud Interface and the Chaos Loader:
http://www-user.tu-chemnitz.de/~sgl/atari/turb6000/turb6000.htm

- turbo 2000: a turbo tape enhancement built in Poland or the former
Czechoslovakia; it worked with different speeds (ranging from 600 Baud
to approx. 9600 Baud?) depending on the program itself and the transfer

program; also required a special loading/saving program, available as
disk-files and cartridges;
For more information on the Turbo 2000 (T2000) and SuperTurbo modifications
to Atari program recorders, with speeds up 9600 baud, see
http://jindroush.atari.org

- rambit turbo tape: a turbo tape enhancement built in the UK by Richard
Gore and sold by Microdiscount (Derek Fern); it worked with 9600 Baud
and came with some special software on disk; Microdiscount also sold
many of its own commercial programs (Zeppelin games, etc.) on Rambit
turbo tape...

Subject: 3.2) What other cassette recorders can I use with my Atari?

Firstly Atari themselves put out several models beyond the 410/1010/XC11/XC12,
generally only known in eastern Europe:

XCA12 Program Recorder -in same case as XC12...Poland
CA12 Program Recorder -in same case as XC12...Poland
image: http://romualdl.multimania.com/images/atari/ca12.jpg
XL12 Program Recorder -XC12 w/slight changed design. Czech/Slovak/Poland
XC13 Program Recorder -XC12 which was "T2000 ready". Czech/Slovak/Poland

Unlike other microcomputer systems of the time, it was very unusual to use
anything but Atari-brand program cassette recorders. One third-party product
released was the:

Compu-Mate, by General Electric (GE, G.E.)
Includes external interface module, a power cord/adapter, and SIO cable.
No second SIO port - must be at end of SIO chain.

Subject: 3.3) How do I run a program from cassette?

To run an Atari BASIC program from cassette:

1. Place the cassette in the recorder.
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Boot the computer to the Atari BASIC READY prompt.
4. There are several possibilities for the next step, depending on how the
program was saved, and whether you want to run the program or just load
it into RAM. Enter one of the following four commands:
a. CLOAD loads programs saved with CSAVE
b. LOAD "C:" loads programs saved with SAVE "C:"
c. ENTER "C:" loads programs saved with LIST "C:"
d. RUN "C:" loads&runs programs saved with SAVE "C:"

] Relative efficiency of the three cassette tape recording techniques:
] CSAVE/CLOAD - most efficient - fastest saves/loads - tokenized files
] SAVE "C:"/LOAD "C:" - middle efficiency - middle speed - tokenized files

] LIST "C:"/ENTER "C:" - least efficient - slowest - straight ATASCII

5. The computer will "beep" as a signal for you to press PLAY on the recorder.
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading has finished.
8. Unless you entered RUN "C:" above, now enter the command: RUN

To run an Atari BASIC or machine language program from cassette upon
startup:

1. Place the cassette in the recorder
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Turn on the computer while holding down the START key.
But if your computer has Atari BASIC built-in and you're running a machine
language program, hold down both the START key and the OPTION key.
4. The computer will "beep" as a signal for you to press PLAY on the recorder.
5. Let go of the START/OPTION button(s).
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading is complete and the program is
running.

Subject: 3.4) What are the Atari 810, 815, 1050, and XF551 Disk Drives?

Section includes contributions by Andreas Magenheimer, TXG.

The Atari Disk Drives provide storage and retrieval of programs
and data on 5.25" floppy disks.

==> Atari 810 --- a 5.25" floppy disk drive
The least common denominator for the Atari. One mode of operation:
1) Single-Sided, Single-Density--
FM 40 tracks x 18 sectors/track x 128 byte/sector = 90K capacity
19.2Kbps transfer rate. 288RPM.
The 810 includes a 6507 microprocessor.
Shipped with DOS 1 (very early) or DOS 2.0S
earlier MPI version- push button door opening for disk access
later Tandon version- lift door, like a garage door disk access
two SIO ports
accessories from Atari:
CX8100 Atari 810 Blank Diskettes (5 per box)
CX8111 Atari 810 Formatted Diskettes II (5 per box)
CX8202 Atari 810/815 Blank Diskettes (5/box, certified for double density)

Third-party upgrades for the 810:
810 Archiver -- copy many copy-protected programs
Happy 810 -- Happy Backup, Warp Speed 52Kbps, 18 sector buffer
810 Fast Chip by Binary 10%-40% faster
810 Turbo by Neanderthal Computer Things (NCT) -- double-density

see: http://www.qnet.com/~dons/810T.html
810 Duplicator (DT-Duplicating Technologies) -- copy disks, double-density,
"read 18 sectors in the time normally for 1"

==> Atari 815 Dual Disk Drive --- dual 5.25" floppy disk drives in one unit
Were produced (all hand-built), but are very rare. One mode of operation.
Per drive:
1) Single-Sided, Double-Density--
MFM 40 tracks x 18 sectors/track x 256 bytes/sector = 180K capacity
19.2Kbps transfer rate. 288RPM.
The 815 includes a 6507 microprocessor.
Shipped with DOS 2.0D
MPI mechanism version- push button door opening for disk access
Tandon mechanism version- lift door, like a garage door disk access
accessories from Atari:
CX8202 Atari 810/815 Blank Diskettes (5 per box, certified for double density)
Stephen Knox writes (12/28/02):
I believe the story on the 815s was Atari didn't want to release them due to
severe QA problems with the drive but they had so many preorders they had to
release something. I think they filled the preorders and then cancelled the
model - Most of them got returned due to problems.

==> Atari 1050 --- a 5.25" floppy disk drive
Same as the 810, plus Dual-Density capability. Two modes of operation:
1) Single-Sided, Single-Density, 90K, 810 compatible
2) Single-Sided, Dual-Density, otherwise known as "Enhanced Density" because
it is not true double-density--
MFM 40 tracks x 26 sectors/track x 128 bytes/sector = 128K capacity
19.2Kbps transfer rate. 288RPM
The 1050 includes a 6507 microprocessor.
Shipped with DOS 2.0S, DOS 3, or DOS 2.5
DIP switches: Black & white left: Drive 1
Black right, white left: Drive 2
Black left, white right: Drive 3
Black & white right: Drive 4
Third-party upgrades for the 1050 (all add a true SSDD 180K capability):
US Doubler (ICD) SS SD/ED/DD UltraSpeed (US) 54Kbps, sector skewing
Happy 1050 SS SD/ED/DD Warp Speed 52Kbps, 36 sector buffer,
(Happy Computers) Happy Backup. also read/write 180K 5.25" MS-DOS floppies
I.S. Plate (Innovated Software) SS SD/ED/DD Ultra/Warp (USD/Happy clone)
Hyper Drive (Chaos! Computers) SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Super Archiver (CSS) SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Super Archiver II(CSS)SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Cheer-Up 1050 SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Speedy 1050 SS SD/ED/DD Warp Speed 57Kbps (Happy clone), 8kb buffer,
(Compy-Shop, now ABBUC) DOS, copier, track & density displays, beep speaker
Mini-Speedy same as Speedy 1050, but without displays & speaker
Super Speedy 1050 SS SD/ED/DD Warp Speed 96,000Baud (Happy clone),192K RAM
SuperMax 1050 SS SD/ED/DD UltraSpeed 52Kbps (US Doubler clone)
Lazer 1050 SS SD/ED/DD Warp Speed and UltraSpeed 54Kbps
Engl-Turbo-1050 SS SD/ED/DD Turbo Speed approx. 70,000 Baud (uses

(german Turbo) Sector skewing that differs from USDoubler)
1050 Duplicator (Duplicating Technologies (DT))
SS SD/ED/DD "read 18 sectors in the time normally for 1"
sources(Jim Patchell)http://www.oldcrows.net/~patchell/atari/duplicator.html
Klone ???????

Rich Mier professes:
You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

==> Atari XF551 --- a 5.25" floppy disk drive. Four modes of operation:
1) Single-Sided, Single-Density, 90K, 810 compatible
2) Single-Sided, Enhanced-Density, 128K, 1050 compatible
3) Single-Sided, Double-Density, 180K, Percom & other 3rd parties compatible
4) Double-Sided, Double-Density--
MFM 80 tracks x 18 sectors/track x 256 bytes/sector = 360K capacity
Writes "backwards" to the second side of the disk, when compared to a two-sided "flippy" disk with SSDD 180K format on each side
High speed 38400 bps burst mode usable only with SpartaDOS X, SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2.
Rotaton rate: 300RPM. Since all other Atari-specific drives run at 288RPM, this results in rare compatibility issues. Specifically, these commercial disks do not load in, and can be damaged by, the XF551:
- Flight Simulator II (subLOGIC)
- Blue Max (Synapse)
- Bank Street Writer (Broderbund). Conflicting reports about this one.
8040 cpu + external ROM or 8050 cpu with internal ROM
Shipped with DOS 2.5 or DOS XE.
DIP switches: Both dips down: Drive 1
Left down, right up: Drive 2
Left up, Right down: Drive 3
Left and Right up: Drive 4
Chinon-built XF551-cannot read/write/format backside if no timing hole
Mitsumi-built XF551--can read/write backside if to timing hole, if formatted
Third-party upgrades for the XF551:
CSS XF Single Drive Upgrade--3.5", 720K floppy drive replacement
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFsingdrup.htm

CSS XF Dual Drive Upgrade--add 3.5" drive w/o losing the 5.25" drive
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFdualdrup.htm
CSS XF551 Enhancer--overcomes sensor for index hole, create flippy disks
see http://www.nleaudio.com/css/products/XF551enh.htm
CSS XF Update--replace drive OS, adds UltraSpeed
see http://www.nleaudio.com/css/products/XFupdate.htm
Hyper-XF-OS--avaiable for 5.25" or 3.5" floppy versions; uses sector skewing
and UltraSpeed (but no track buffer!); can use disk partitions
(2 on 5.25", 4 partitions on 3.5") with mixed Densities (S/E/D)
or standard 360kbytes (5.25") / 720kbytes (3.5"); can
theoretically read/write ST/PC 720k disks (software is missing!)
OS created by Stefan Dorndorf/Germany;
XF-Speedy--replaces the 8040 CPU with a 65C02 + ROM + Memory

Subject: 3.5) What other floppy disk drives can I use with my Atari?

While any standard "slave" drive will work with "master" drives listed above,
the following are slave drives marketed specifically to Atari users:
Access Unlimited ATAR88-A1 SS SD slave
Access Unlimited ATAR40-A1 SS SD/DD slave
Concorde C-221S SS SD/DD slave
Concorde C-222S DS SD/DD slave
Percom RFD40-A1 SS SD/DD slave
Percom AT88-A1 SS SD/DD slave
RCP 100 DS SD/DD, slave
RCP 200 DS SD/DD dual drives, slave

Subject: 3.6) What kinds of 5.25" floppy disks can I use with my Atari drives?

Russ Gilbert writes:
If you're talking standard computer store, you can't use those 5 1/4" disks. I
mean you can't use high density disks. They must be double density to use
with the 1050. Almost all double density 5 1/4" disks have a hub ring, high
density disks don't have the hub ring.

RHamiIton5 elaborates: (5/12/01)
The Atari 8 drives do not have write heads and circuity which can handle the
type of oxide coating used on the high density floppy media; they cannot write
reliably to them. The hub ring has just become a sort of marker to distinguish
the high density from the standard double density diskettes.

Way back in your apple days of '79-'82, most disks were hubless and only the
really premium brands offered hubs to prevent slippage and out of round
problems; you could even buy little kits for adding you own hub rings.

When the home computer swell really hit around '83 and price wars began, hub
rings became common on good disks and eventually became standard down to
include most generic bargain diskettes.

The introduction of high density 5.25's required a different coercivity (=
magnetizability) to get more bits in a smaller space and suitable electronics
to do it. These disks were produced hubless; was it a differentiating label or
just unnecessary because of stronger mylar construction? Anyone?

Subject: 3.7) What can I do to extend the life of my floppy disks?

Lee Hart writes (January 2004):

Personally, I have several hundred floppy disks for my Atari 800, Kaypro
4, Heathkit H89, and IMSAI 8080 computers that are 10-20 years old. What
I can say in general:

- Most disks stored in plastic boxes or ziplock baggies survived.
- Most disks stored in cardboard boxes or just their sleeves
did NOT survive.
- Some brands lasted better than others, but I haven't collated the
information so as to make any kind of definitive statements.
- If a disk cannot be read, CLEAN THE DISK DRIVE HEAD before attempting
to read another disk! Otherwise, crap from the bad disk will remain
on the head, and will scar and destroy any SUBSEQUENT disk you put
in the drive! (the voice of painful experience).
- For lack of a better plan, for each of my surviving disks I am:
a. reformatting another blank disk
b. copying the data from an old disk onto the blank disk
Then I have a more recently-produced backup disk in case the
original disk later fails.

Subject: 3.8) How can I use a hard drive with my 8-bit Atari?

Atari never produced hard drives for the 8-bit Atari, but a variety of options
have been produced over the years. No common DOS version was written with
drives the size of hard drives in mind, and very few 8-bit Atari users have
owned hard drives for the Atari. Yet, if you're serious about it, a hard
drive can make a tremendous addition to your system!

A couple of these options are hard drives designed specifically for the 8-bit
Atari computers; the rest are interfaces designed to let you attach an
industry standard SASI, SCSI, or IDE type hard drive. Customized software
(OS, DOS) is often involved as well.

Larry White contributed to some of these descriptions.
Additional Corvus info from an eBay auction by Ben Corr, 7/03.

==> Corvus hard drive (5MB, 10MB, or 20MB)
Attaches via joystick ports 3 & 4 on the Atari 800 only.

-- Corvus Integrator Board - alows access to the Corvus Disc without the
Corvus software, so that any DOS that uses standard SIO calls will work.

-- Corvus Multiplexer - used to network up to 8 Ataris to one Corvus Drive

- Corvus Mirror card - back up the drive's contents onto video tape

==> SupraDrive Atari Hard Disk, by Supra, later K-Products. 10MB or 20MB.
includes external Hard Disk Interface
Some limitations on drive type and size and total number of drives in sys.
Attaches via PBI, or ECI with adapter.
See: http://www.atarimagazines.com/v5n6/Supradrivefor8Bit.html
Maybe still available from Bob Klaas?

==> BTL Hard Disk System
BTL 2001 Connector for 600XL/800XL PBI
BTL 2002 Connector for 130XE/800XE/65XE ECI
BTL 2004 SASI Hard Disk Adapter
See: http://www.atarimagazines.com/v5n12/BTLHardDisk.html

==> Multi I/O (MIO) interface, by ICD. Includes:
- Parallel printer interface
- Serial interface, for modem or serial printer. will handle 19.2Kbps
- 256K or 1 MB RAM, for RAMdisk or printer spooler
- SASI/SCSI interface, supports up to 8 controllers.
Limited to drives with 256-byte sectors.
Attaches via PBI, or ECI with adapter.

==> CSS Black Box interface
RS-232 Serial Modem Port (19.2Kbps) w/ hardware flow control,
Parallel Printer Port,SASI/SCSI Hard Disk Port, Operating System Enhancements,
optional 64K printer buffer. Supports drives with 512-byte sectors.
PBI/ECI device. Available: http://www.nleaudio.com/css/products/black.htm

==> SmartIDE project by Bob Woolley
Uses 256 of the normal 512 byte sectors. Point-to-point wiring project.
Articles and software at http://www.wolfpup.net/atari/atari.html

==> IDE Hard Drive Interface 1.0
By Konrad M. Kokoszkiewicz (Draco) and Jacek Zuk
PBI device. Logical sector length: 256 or 512 bytes
Availability???

==> Fine Tooned Engineering (FTe) Multi I/O II (MIO II) interface
An IDE interface. Several exist, but it was never really released

==> msc-IDE Controller
created by Steve Birmanns and Matthias Belitz
* real device for the parallel-port (PBI/ECI) of the Atari XL/XE
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* software partially supports CD-ROM and ZIP drives.
Sold out.
http://www.birmanns.de/atari/

==> Gary Morton's BadSector"A" Project
Wants to connect his IDE drive to the SIO bus.
http://www.alma.demon.co.uk/Atari/AtariProjects.html

==> MyIDE interface and software by Mr.Atari, Sijmen Schouten
Point-to-point wiring project. Different units for 800 and XL, including a
cartridge version for the XL.
http://home.wanadoo.nl/mr.atari/

==> SIO2IDE, by Marek Mikolajewski (MMSoft)
The SIO2IDE is a simple interface that allows you to attach any IDE Disk
Drive to your 8-bit Atari computer. Latest interface version has the
following main features:

* ATARI side:
- uses standard Atari SIO at a speed of 19200 baud
- works with Atari High Speed SIO (US and Happy) at a speed of 52000 baud
- emulates Atari disks D1: to D8:
- can be used with any Atari DOS and OS
- can be used without any problems with other SIO devices (disk drivers,
printers, modems, SIO2PC, second SIO2IDE etc)
- can be easy installed inside your Atari with 2.5' laptop HD
- is easy to configure via special fdisk.com utility software
(changing disks sequence and active directory)
* IDE device side:
- all IDE ATA/ATAPI devices can be used: Disk Drives (2.5' and 3.5'),
CD-ROMs, Compact Flash cards etc.
- supports PC file systems, FAT16 and FAT32
- supports CD file system, ISO9660
- supports ATR disk images (SD, DD up to 16MB)
- supports directory change (multiconfig)
- is easy to configure, many text configuration files (sio2ide.cfg) can
be stored in different directories
- disk configuration can be checked by special checkfs.exe PC utility
NOTE: checkfs.exe does NOT work with HDD connected via USB port
- standard disk utilities can be used (defrag.exe, scandisk.exe etc)
* USB port side:
- interface works as Mass Storage Class device (removable drive)
- no drivers are needed for Windows 2K, ME, XP
- driver for Win98 is included in this SIO2IDE package

http://www.atari.cuprum.com.pl/sio2ide.htm

==> Nathan Hartwell's IDE projects
http://www.magelair.com/

Subject: 4.1) What are the Atari 820, 822, and 825 Printers?

The following printers were produced by Atari and styled to match the 400/800
computers.

Atari 820 Printer:
- 40-column impact printer
- 5x7 dot matrix
- 40 characters per line, upper & lower case alpha
- horizontal and vertical alphanumeric characters
- 6507 microprocessor, 6532 RAM I/O chip, 2K ROM
- 40 characters per second
- uses Standard Roll Paper/adding machine paper

Atari 822 Thermal Printer: (= Trendcom Model 100)
- 37 characters per second
- 10 characters per inch
- 40 characters per line, upper/lower case and point graphics
- 5x7 dot matrix

Atari 825 80-Column Printer (= Centronics 737)
- 3 character sets:
monospaced 7x8 dot matrix at 10 characters per inch
monospaced condensed at 16.7 cpi
proportionately spaced Nx9 dot matrix at avg of 14 cpi (N=6..18)
- all characters can be elongated (printer double width)
- characters per line: 80 at 10 cpi; 132 at 16.7 cpi
- speed: 50 cps at 10 cpi; 83 cps at 16.7 cpi; 79 cps avg. proportional
- print buffer: 1200 dot columns
- paper: roll, fanfold, or cut sheets
- requires Atari 850 Interface Module or equivalent

Subject: 4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?

The following printers were produced by Atari and styled to match the XL
series computers.

Atari 1020 Color Printer:
(= Commodore 1520 / Oric MCP40 / Tandy/Radio Shack CGP-115 /..; made by ALPS)
- 4-color graphics: (black, red, blue, green). optional 8-pen rainbow package
- alphanumberics and X,Y plotting capability
- 10 cps (40-column mode)
- 20, 40 and 80-column modes
- horizontal and vertical alphanumerics, English and International chr sets
- water soluble ink pen technology
- 4-pen barrel print head
- microprocessor
- paper: standard roll paper (40 column width)
- AtariGraphics cassette software included

Atari 1025 80-Column Printer: (= Okidata ML80)
- 40 cps (80-column 10 cpi mode)
- 5 cpi expanded (40 col), 10 cpi (80 col), 16.7 cpi condensed (132-col)
- 5x7 character dot matrix
- buffer: 132 chrs at 16.7 cpi, 80 chrs at 10 cpi
- paper: roll,fanfold,single sheets. optional:roll paper holder, tractor feed

Atari 1027 Letter Quality Printer: (= Mannesmann Tally Riteman LQ.)
- fully formed characters, prestige elite 12)
- 12 characters per inch (80 columns)
- 20 characters per second
- single sheets or roll paper

Atari 1029 Programmable Printer (by Seikosha)
- 7-pin dot matrix, same as Commodore MPS-801
- Released for Europe & Canada (not USA)

- Rich_N_Feymus says:
I think its a SEIKOSHA GP500, but not 100% sure. However, the
Commodore MPS-801 ribbons should be much easier to find.
- The Tandy DMP 110 is another model reported to be the same as the 1029.

Subject: 4.3) What are the Atari XMM801 and XDM121 Printers?

The following printers were produced by Atari and styled to match the XE
series computers.

Atari XMM801 Printer: (= SHINWA CP80)
- 80 columns, dot matrix
- friction feed or pin feed
- pica 10 cpi, double width pica 5 cpi, elite 12 cpi,double width elite 6 cpi,
condensed 16.5 cpi, double width condensed 8.25 cpi
- Ribbon: Commodore 1526 and the Mannesman-Tally Spirit 80

Atari XDM121 Printer:
- 80 column, daisy wheel--letter quality
- underlining, subscripts, superscripts
- friction feed paper
- Ribbon: Silver Reed CF130, Olivetti ET201,ET221,Nu-Kote NK136

Subject: 4.4) What other printers can I use with my Atari?

Some third-party printers were marketed for use with the Atari 8-bit
computers:

Alphacom 42 + Atari interface cartridge
- requires 850 Interface or equivalent
- thermal
- 4 1/2" width paper
- supports complete ATASCII character set

Axiom AT-100 / Seikosha AT-100 / Seikosha GP-100A Graphic Printer
- built-in Atari interface, cable and connector, 2nd SIO port for daisy-chain
- dot matrix
- early model 30-cps, later version 50 cps
- Graph-AX graphics software package

Axiom GP-550AT (by Seikosha)
- built-in Atari interface, cable and connector, 2nd SIO port
- dot matrix
- 86 cps draft, 43 cps NLQ
- Graph-AX graphics software package

Axiom GP-700AT (by Seikosha)
- built-in Atari interface, cable and connector, 2nd SIO port
- 4 hammer print heads, 4-color ribbon cartridge
- 25 colors

- 50 cps
- Graph-AX graphics software package

Epson HomeWriter 10
- plug-in cartridge interface for the Atari
- 80 column dot-matrix printer
- draft quality printing at 100 cps and near letter quality at 16 cps

General Electric GE 3-8100 / TXP 1000
- GE Printer Interface Module for Atari
- dot-matrix
- 50 cps draft, 25 cps NLQ

Okidata Okimate 10 Personal Color Printer
- available Plug 'n Print Interface for Atari
- a thermal printer.
- single-sheet or tractor-feed paper.
- 26 colors
- 240 words per minutes

Beyond the above printer models, most any "industry-standard" line printer can work well with the Atari. For many years, most printers marketed for home use could be classified into one of two categories: parallel or serial interface. Parallel line printers are much more commonly used than serial line printers, with the Epson MX/FX/LX series defining the market.

The most common way to use an industry standard printer with the Atari has been to attach it through the 15-pin 8-bit parallel port of the Atari 850 Interface Module or equivalent (such as the ICD P:R: Connection). One gotcha here is that the 850's parallel port is DB15, where the PC world ended-up standardizing on a DB25 configuration. So you need to find or build a cable that provides the DB15 connector for the Atari end (and Centronics-type parallel connector on the printer end) when attaching a standard parallel printer to the Atari through an Atari 850 or equivalent.

Many 3rd-party disk drives for the Atari (along with the XEP80 Interface Module) do include a DB25 parallel printer port, rendering the need for an Atari-specific printer cable unnecessary.

The Atari 850 Interface Module and equivalents also provide standard DB9 serial RS232C ports, permitting use of standard serial line printers with the Atari. But this is much less common than parallel, both in the Atari world and in the industry at large.

Some folks have connected more modern inkjet and laser printers with parallel connections to the 8-bit Atari with success. Graphics printouts from the Atari may be less than ideal (look for a printer with an Epson MX/FX/LX printer series emulation mode), but these types of printers should work fine for plain text output if they can handle simple line print jobs. Anyone want to contribute their experiences to be included here?

Bob Woolley wrote on Sun, 14 Apr 2002:
I use HP LaserJet 4Ps on my Ataris. They are one of the last front panel

selectable cheap printers - from which you can select your default fonts, etc. The newer laser printers can only set fonts and operating modes thru the interface, not impossible, but not as easy as selecting on the panel. This does allow you to print just about any point size of the internal fonts in the printer on your Atari.

Either way, you really have to do a little work to get properly formatted output from a word processor. I have managed to use the proportional font setting with AtariWriter and printer driver creation utilities to get good results.

Mathy van Nisselroy provides an AtariWriter printer driver for the HP LaserJet here: http://www-users.rwth-aachen.de/mathy.van_nisselroy/stuff.htm

Modern printers designed for home markets now tend to provide USB connectors.

Subject: 5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?

A MODulator/DEModulator translates digital information from your computer into acoustic tones that can be sent and received, from modem to modem, via standard telephone lines.

Atari produced several modems for use with the 8-bit Atari computers:

Atari 830 Acoustic Modem: (= Novation 'CAT')
- a stand-alone, acoustically coupled, frequency shift keying (FSK) modem
- up to 300 bits per second
- Bell 103/113 modem compatible
- requires Atari 850 Interface Module or equivalent

Atari 835 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible

Atari 1030 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible
- built-in ModemLink software.
- 2 SIO ports

Atari XM301 Modem:
- 300 bps
- Bell 103/113 modem compatible
- with XE Term disk software
- permanent SIO cable, must be at end of SIO chain
- draws its power from the computer via SIO

Atari SX212 Modem:
- SIO & DB25 RS232 serial ports, must be at end of SIO chain
- 1200 baud
- Bell 103/113/212A modem compatible
- rarely with SX-Express! disk software.

Subject: 5.2) What other modems can I use with my Atari?

Some third-party modems were marketed for use with the Atari 8-bit
computers:

==> Microconnection, by Microperipheral Corp.
300 bps, Bell 103 compatible, T-SMART software, pulse dialing (not touch tone)
Four versions:
buss-decoding version does not require 850 Interface or equivalent, includes
DB25 parallel printer interface, with or without autodial
Plain version requires 850 Interface or equivalent, with or without autodial
and autoanswer

==> MPP-1000C, by Microbits Peripheral Products
300 baud, joystick port 2, Smart Terminal cartridge

==> MPP-1000E, by Microbits Peripheral Products
300 baud, joystick port 2, Smart Term software
From: "Steven J Tucker" Sun, 13 Jan 2002 16:14:38 -0500
The 1000E..had this strange problem in that it could never hang up the phone

==> MPP-1200A, by Microbits Peripheral Products
Released? Vaporware?
1200 bps, joystick port 2

==> 300 AT, by Supra (same as MPP-1000E)
300 baud, joystick port 2, Smart Term software

==> 1200 AT, by Supra
1200 baud, Hayes compatible, connects to SIO via SupraVerter/R-Verter cable,
Smart Terminal software

==> Volksmodem, by Anchor Automation
300 baud, 'F' Cable permits connection to joystick port 2

==> Q-MODEM, by Quantum Microsystems
300 baud, two SIO connectors, QuanTerm disk or cartridge

Beyond the above modem models, most any "industry-standard" external serial
modem can work well with the Atari. These have been commonly sold for PCs for
many years. The Hayes Smartmodem more or less defined the market for these,
initially.

One common way to use an industry standard external serial modem with the
Atari is to connect it to the SIO port via an Advanced Interface Devices
(A.I.D., later Supra) R-Verter Serial Bus Modem Adapter cable, or
equivalent.

The other common way to use an industry standard external serial modem with
the Atari is to attach it through the 9-pin RS232C serial port of the Atari
850 Interface Module or equivalent (such as the ICD P:R: Connection). One
gotcha here is that the serial port on the 850 is DB9 female, where the PC
world ended up standardizing on a DB9 male connector for this purpose. But

gender converters are readily available.

For using modems at speeds of 2400 bps and up with the Atari, it will be useful to have an understanding of data flow control. Here is a definition of flow control from www.modems.com:

Often, one modem in a connection is capable of sending data much faster than the other can receive. Flow control allows the receiving modem to tell the other to pause while it catches up. Flow control exists as either software, or XON/XOFF, flow control, or hardware (RTS/CTS) flow control. With software flow control, when a modem needs to tell the other to pause, it sends a certain character, usually Control-S. When it is ready to resume, it sends a different character, such as Control-Q. Software flow control's only advantage is that it can use a serial cable with only three wires. Since software flow control regulates transmissions by sending certain characters, line noise could generate the character commanding a pause, thus hanging the transfer until the proper character (such as Control-Q) is sent. Also, binary files must never be sent using software flow control, as binary files can contain the control characters. Hardware, or RTS/CTS, flow control uses wires in the modem cable or, in the case of internal modems, hardware in the modem. This is faster and much more reliable than software flow control.

Some 2400 bps modems, and probably all modems with 9600 bps speed capabilities and up, normally use V.42 standard error correction and V.42bis standard data compression. But V.42 requires either software or hardware flow control, and V.42bis requires hardware flow control (and V.42 error correction).

Hardware flow control is not available with the Atari 850's serial ports.

As a result, just before dialing out with your Atari telecom software, it's usually desirable, if not necessary, to disable your modem's flow control.

The Hayes modem command to disable flow control looks like:
AT&K0

The top speed of the Atari 850's serial ports is 9600 bps.

Clay Halliwell offers a tip on utilizing 9600 bps through the 850 Interface:
On 11 Feb 1996, Marc G. Frank said:

> I'm having problems getting a modem attached to my Atari 850 to
> communicate at 9600 baud. When I set my communications program to 2400
> baud, everything works fine. However, when I set it to 9600 baud, the
> modem echoes my characters but doesn't act on them. That is, at 2400,

The problem with the 850 is that some of them (like mine) don't produce a PERFECT 9600 baud signal. As a result modems can't train on it, and while they will echo characters back, for some nitpicky reason they won't pick up on the "AT" attention code.

The solution is to do all your dialing at 2400 baud, but set the S37 register to force the modem to try to connect at 9600. Then switch your Atari to 9600 after connecting.

Through the use of an ICD MIO or a CSS Black Box, it is possible to utilize modems at speeds up to 14.4 Kbps (V.32bis) at full speed with no loss of data. The serial R: device handler for the Black Box supports hardware flow control natively. Optional for the Black Box, but essential for the MIO, is the HyperSpeed handler by Len Spencer.

Hyperspd.arc is available at http://members.aol.com/lenspencer/atari8.htm

---

Subject: 6.1) What is the Atari 850 Interface Module?

While the Atari's SIO and controller ports did not conform to established industry standards, Atari produced the 850 Interface Module to address this issue. The 850 connects to the SIO port on the Atari, and provides:

- four 9-pin serial EIA RS232C ports
- One 15-pin 8-bit parallel Centronics-type port

Many "industry standard" (of the time) printers, modems, and various other devices can be used with the Atari computer in combination with an 850 Interface Module.

Early 850's are in an all metal (black) case, but most are in a plastic beige case matching the 400/800 computers. Other features:
- programmable baud rate on any port, including:
75, 110, 134.5, 150, 300, 600, 1200, 1800, 2400, 4800, and 9600 bps;
baudot speeds of 60, 66, 75, 100 words per minute
- uses standard ASCII. Baudot support for radio-teletype (RTTY).

PINOUTS

Because the 850 was relatively expensive, provided more capabilities than the average user was looking for, and was at times unavailable from Atari despite high demand, there were many 3rd-party interfaces designed to provide some compatible subset of the 850's features. Perhaps the most prominent example of such a product is the P:R: Connection from ICD.

Subject: 6.2) What is the Atari XEP80 Interface Module?

This text written by Thomas Raukamp.

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace

80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 6.3) What accessories did Atari produce for their 8-bit computers?

This should be a complete list of Atari "CX" accessories, two or three digit numbers, marketed for use with the 8-bit computers.

CX30-04 Paddle Controller Pair
CX40-04 Joystick Controller Pair
CX40 Single Joystick Controller
CX41 Joystick Repair Kit
CX22 Trak-Ball Controller
CX23 Kid's Controller
CX24 Pro-Line Joystick
CX42 Remote Control Wireless Joysticks
CX50 Keyboard Controller Pair
CX70 Light Pen (beige; the original Atari light pen)
CX75 Light Pen (+ Atarigraphics cartridge)
CX77 Touch Tablet (+ AtariArtist cartridge)
CX78 Joypad (shipped with the 7800 in Europe)
CX80 Trak-Ball
CX81 I/O Data Cord (5 ft)
CX82 Monitor Cable (Black and White Monitor)
CX85 Numerical Keypad (+ software Handler on diskette)
CX86 Printer Cable (included with 825 Printer)
CX87 Interface/Modem Cable (included with 830 Acoustic Modem)
CX88 Interface/Terminal Cable (null modem)
CX89 Monitor Cable (Color Monitor)
CX418 The Home Manager Kit (Personal Financial Management, Home Filing Manager
-or- Family Finances, The Home Filing Manager)
CX419 The Bookkeeper Kit/Atari Accountant (The Bookkeeper disk, CX85 keypad)
CX481 The Entertainer (Star Raiders, (Missile Command or Pac-Man),2 joysticks)
CX482 The Educator (410, BASIC cart., States & Capitals cassette)
CX483 The Programmer (BASIC, BASIC Ref. Manual, BASIC Self-Teaching Guide)
CX484 The Communicator (850, 830, TeleLink I cart.)
CX488 The Communicator II (835, TeleLink II cart.)
????? The Arcade Champ (Pac-Man, Qix, 2 joysticks, cartridge storage case)
????? The BASIC Tutor I (Inside Atari BASIC bk,Invitation to Programming 2&3)
CX852 8K RAM Memory Module (for 800 computer)
CX853 16K RAM Memory Module (for 800 computer)
XG-1 Light Gun (+ Bug Hunt cart.)

Subject: 6.4) What "vaporware" computers/peripherals were never released?

Atari was a HUGE company, dominating Silicon Valley, and included a massive
research and development department which famously designed many, many
products that never saw the light of day. Here is a brief listing of many
Atari hardware model designations known to have existed internally to the
company, but which were never sold and are extremely rare (if they ever
existed at all). For definitive information on unreleased Atari products,
see:

Atari Historical Society, http://www.atari-history.com/ (Curt Vendel)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL

1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XL brown prototype
800XLD low-cost 1450XLD,no modem&speech,incl disk drive controller&FREDDIE
800XLCR Cost Reduced, with CGIA chip ("Keri"), which is a combined GTIA&ANTIC
900XLF early name for 65XE
1250XLD Earlier name for the 1450XLD
1400XL brown prototype
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives(controller not included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard
1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMY sound chip

Atari 8-bit vaporware peripherals: (note some are more vaporous than others)
1027 PLUS -daisy-wheel, 80 columns
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80col display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor (Goldstar)
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 6.5) What are the power requirements for my Atari components?

Thanks to Matthias Belitz for the European data in this section. I need more
international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output).
The power (in voltamps or watts) and current (in amperes) specifications
of the original equipment as presented here should be regarded as
minimum values. Higher-than-specified power and current capacities are
entirely usable, and often preferable because such supplies run cooler
and last longer.

Direct Current (DC):
Power (in watts) = current (in amps) * voltage (in volts)

Alternating Current (AC):
Apparent Power (in voltamps) = current (in amps) * voltage (in volts)
Effective/True Power (in watts) = current (in amps) * voltage (in volts)
* (cosine of the angle of lag)

N O R T H A M E R I C A INPUT = 115-120 V AC, 50/60Hz

MPP1000C modem: 9 V DC 200 mA (1.8 W)

Subject: 6.6) What graphic tablets were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Touch Tablet by Atari (came with Atari Artist cart., Micro Illustrator compatible),
- Koala Pad by Koala Industries (came with Koala/Micro Illustrator cart.);
- Powerpad by Chalkboard Inc. (came without software!); the following carts were available separately for the Powerpad: Micro Illustrator, Leo's Lectric, Micro Maestro, The Programmers Kit, Logic Games, Bear Jam (as refered to Antic, September 1984);
- Animation Station by Suncom (came with Micro-Illustrator cart.);

Subject: 6.7) What lightpens were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Lightpen (came with Atari Graphics cart.; it produces pictures with 127 sectors in length, thus not Micro-Painter, nor Micro-Illustrator compatible; however appropriate converter programs can be found in the public domain, e.g. the Rapid Graphics Converter);
- Edumate Lightpen (came with a disk with 6 Basic programs; a program called Peripheral Vision was available separately from Future House);
- Tech-Sketch-Lightpen (came in two versions: a) the cheaper version which included a disk with Basic programs only and b) the more expensive version which included the disk with Basic programs and the Micro-Illustrator cartridge);
- MC-Pen-Lightpen (came with a disk with 4 Basic programs);
- Reston Lightpen (came with ???);

Note: these infos were taken from Antic, September 1984; I am not sure, if all these items were really available as listed...

Subject: 6.8) What lightguns were produced for the Atari?

This section by Andreas Magenheimer.

- Atari LG-1 Lightgun (came in two versions: a) complete with XEGS, keyboard, joystick, power supply, tv-cable, Lightgun, FS II cart and Bug Hunt cart all in one package and b) in a separate package, containing the Lightgun and the Bug Hunt cartridge); thats's why Bug Hunt does not have its own package, it was always included with the Lightgun package and/or the complete XEGS package...
- BEST Lightgun by Best Electronics (a sort of selfmade (?) Lightgun);
- Sega-Lightgun (normally not Atari compatible; but can be converted into an Atari compatible lightgun easily);
- other lightguns (most of these have to be converted)...

Note: After having 3-4 Atari and at least one (converted) Sega lightgun, it is my personal impression, that the Atari lightgun merely works ok on/with TV-sets (and not at all with a monitor), whereas the Sega lightgun works alright on TV's and (most) monitors. Since I never had a Best lightgun I cannot comment on this one... (Andreas Magenheimer);

Subject: 6.9) What paddles were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Paddles (usually a pair of Paddles);
- Telegames Paddles (available as a) a single paddle and b) a pair of paddles);
- Reston Paddles (available as a) a single paddle and b) a pair of paddles);
- and many others...

Note: Both single and duo (pair) paddles are compatible to each other, using only one port-connector (only one joystick port). Thus, with a pair of paddles you can connect up to 4 paddles (2 pairs) to the XL/XE models and up to 8 paddles (4 pairs) to the Atari 400/800 models.

Subject: 6.10) What voice/sound synthesis hardware was produced for the Atari?

This section by Andreas Magenheimer.

- Voice-Box II by The Alien Group (a software and hardware package);
- 1400XL/1450XLD Voice Synthesizer (built-in chip inside the extreme rare Atari 1400XL/1450XLD models);
- Talk is Cheap by Ed Stewart, Antic Volume 2 Number 4, July 1983, pages 64-66; hardware schematics only (a test/demo program is mentioned in the text, but not printed in the magazine!);
- Cheap-Talk by Lee Brilliant, Analog Computing, issue 29, April 1985, pages 59-67; hardware schematics and software demos, for example "First Words");
- many other voice synthesizers (mostly selfmade and based on a chip by National Semi Conductor);

Subject: 6.11) What sound-digitizers/samplers were produced for the Atari?

This section by Andreas Magenheimer.

- Parrot (2-Bit) by Alpha Systems, Anthony Ramos;
- Parrot-2 (2-Bit or 4-Bit?) by Alpha Systems, Anthony Ramos;
- 2-Bit Replay (2-Bit) by 2Bit-Systems Ltd.
- Sound N'Sampler (2-Bit) by Ralf David;
- Sound Digitiser (2-Bit) by Ralf David;
- Sound-Meister (2-Bit) by Irata;
- Sound-Digitizer (2-Bit) by Irata;
- Digitales Mikrofon (2-Bit) by Compyshop;
- Voice-Master (2-Bit) by Covox Inc.;
- Analog-Sample-Processor (2-Bit) by Steven Lashower (Analog Magazine);
- Atari-Sound-Sampler (2-Bit) by Andreas Binner and Harald Schoenfeld (german Atari magazin 1/1989, pages 44-49, complete with schematics, documentation, sample-program and assembler-source);
- Alphasys-Sound-Sampler cart. (4-Bit) by ANG/Mirage (released as a mono version; a stereo (two Pokeys!) version was promised/planned, but afaik never released);
- ARGS-XE-Sampler (8-Bit) by ABBUC regional group ARGS (only one or two prototypes exist, alas the hardware was never released due to lack of (sampling/digitizing) software; maybe a good idea for the hardware and software experts out there!);
- and many others ...

Subject: 6.12) What sound-enhancement upgrades were produced for the Atari?

This section by Andreas Magenheimer.

a) enhancements for stereo-sound:

- POPS, polyphonic-pokey-sound by Lee Brilliant (stereo-support with one Pokey!); refer to Analog Computing, issue 66, november 1988, pages 54-60; only 1-2 programs exist for this mod., see: 8.14 stereo-software for the Atari;

- stereo with two Ataris (and thus 2 Pokey chips); use computer/pokey 1 for the left channel and computer/pokey 2 for the right; no special hardware required for this trick (but specially programmed software!); see also: 8.14 stereo-software for the Atari;

- stereo with 2 Pokey chips (in one Atari!); refer to an article written by Chuck Steinman (which probably appeared in Atari classic?) on how to upgrade your Atari internally with a second Pokey chip; or ask Freddy Offenga for a deluxe-stereo-version, that uses a PCB instead of the piggy-back method. For a list of software that supports this mod. see also: 8.14 stereo-software for the Atari;

- Stereo-Blaster and Stereo-Phaser by Portronic/AMC-Verlag, these were hardware add-ons that connected via the monitor jack to the Atari and

gave you "another" monitor jack and 2 cinch connectors to connect to the monitor and/or the hifi-system; various small paddles (4-10, depending on the model you have) make it possible to change amplitudes, frequencies, etc. and thus generate a "pseudo-stereo" sound. These add-ons also amplified the sound and thus made quality recordings of Atari sounds much easier. Alas, these hardware add-ons were quite expensive and thus not many (less than 100) were sold. Therefore no special software is required, every A8 sound can be changed or enhanced to "simulated-stereo"...

- Stereo-Blaster-Pro, a hardware add-on by Portronic/AMC-Verlag similar to Stereo-Blaster and Stereo-Phaser, but programmable! This add-on had only 1 small paddle, to amplify the sound-volume; the stereo-sound could be generated via two simple Poke-Statements, a demo-disk therefore was included. Alas, not many items were sold and afaik no-one else programmed stereo-software for it. See also: 8.14 stereo-software for the Atari...

b) other sound enhancements:

- Covox-Sound-Enhancement, originally developed in Poland; with some electronic parts and pieces you can upgrade your Pokey's abilities, to playback any digitised/sampled sound with 8-Bit resolution, instead of its usual 4-Bit digi/sample playback resolution (see also 8.14).

- SID-upgrade, the SID is the standard sound-chip in the C64 computers. Some polish freaks/nerds have found a way to include it into an A8, but allthough I have seen quite a lot of pictures (for example at atariarea.nostalgia.pl) with this mod. and already found 1 or 2 programs that detect it (for example System Info 2.x by Draco), I have not yet found any schematics for this upgrade. Anyway, it exists, and with some programming skills it would surely be possible to write programs then, that playback SID sounds on those Ataris which have this upgrade installed...

- Amie/Amy sound-chip, the Amie sound-chip was originally produced by Atari and installed into the 65XEM computer. Alas, it was never available to the public and only very few prototypes of this 65XEM (maybe less than 10?) do exist. Besides of that RUMOURS say, that Atari had quite some problems with this soundchip and never finished it completely/successfully. If the rumours are true, then this soundchip provided many more sound channels, more octaves and even more and better sound power than two Pokeys together (for more infos take a look at this URL:)

- guess there are dozens of other sound enhancements, for example sound cards (like Adlib, etc.), sound-chips, midi-interfaces, etc. that could be attached or converted to the A8; I won't name them all here...(A.M.)

Subject: 6.13) What MIDI enhancements are there for the Atari?

This section by Andreas Magenheimer and Mathy van Nisselroy.

Midi is standard on the Atari ST computers, because it is built-in into these computers. Nevertheless, Midi was long before the arrival of the ST computers on the market and thus, it is no surprise that there are even midi-interfaces and enhancements for the classic 8Bit Ataris. The following "types" do exist:

- "Midi-Mate" and "Midi-Track" by Hybrid Arts (USA), comes with hardware + software, see reviews & tests in Antic, Analog and other magazines. MidiTrack requires 48k RAM, MidiTrack II 64k RAM and MidiTrack III 128k RAM (XE compatible, not Axlon compatible). MidiMate features MIDI IN+OUT and SYNC IN+OUT ports, but lacks a second SIO plug. MMS (MIDI Music System) is a MIDI version of AMS, also sold by Hybrid Arts and comes with AMS to MMS converter software...

- "MIDI Master" by 2-Bit Software (UK), comes with hardware+software. Features MIDI IN+OUT ports, an extra SIO plug, but no SYNC ports. See also reviews and ads in (New) Atari User...

- "MIDI interface" by DIGICOMM (UK), comes with hardware + 'example programs'. Features MIDI IN, THRU and OUT ports. There`s no word about a second SIO plug or any SYNC ports. See also reviews and ads in (New) Atari User...

- "MIDIMAX" by Wizztronics (UK), comes with hardware and software. Features MIDI IN+OUT ports and a second SIO plug. The MMS software that comes with MidiMax requires 48k RAM and is fully compatible to the Hybrid Arts hardware+software. This means, one can use the software with both Midi-interfaces or use the interfaces with the software of both vendors...

- "Atari-Midi-Interface" by Karlheinz Metscher (appeared in the german magazine Computer Kontakt June/July 1986, pages 69-75, complete with documentation, schematics and its first program "Midi-Receiver"; in Computer Kontakt October/November 1986 appeared the second program, called "Midi-Disk" - a Midi Recorder and Player program);

- "Midi-Interface for Atari XL/XE" by Ireneusz Kuczek (appeared in the german ABBUC magazine, issue 65, pages 3-6); the paper-mag. includes a schematic for the midi-interface and some translated descriptions for the software (translated from polish to german language), whereas the disk-magazine contains the midi-programs "Midiplay Version 1.3" by I. Kuczek, "Midi-Recorder Version 1.2" by I.Kuczek, "Rec to Mid" by I. Kuczek (a converter program for the IBM-PC!), "Midi-Sequencer V.1.15" by Maciej Sygit and "Midi-Pattern-Editor MPE V.2.3" by Radek Sterba. These programs and many additional demo sounds are also available in the ABBUC PD library (PD numbers 625-632).

- guess there are several other (selfmade) midi-interfaces for the Atari 8Bit available, alas they also require a keyboard or synthesizer and self-created (or downloaded) midi-sounds can only be played back via such a midi-interface and the affore mentioned keyboard/synthesizer. As of yet, it seems there exists no midi-player program, that can

playback any midi-sound via the Atari Pokey chip, nor any converter
program, which can convert *.MID sounds into other Atari sound formats
(that could be played back on the Atari then)...

Subject: 6.14) What graphics enhancements are there for the Atari?

This section by Andreas Magenheimer.

- some 80 column interfaces made by Atari and third parties. Allthough
these interfaces are there to provide a better text display with 80
chars. per line, they can somehow be used as a simple graphic
enhancement; think I have seen a graphic demo for the XEP-80 device
somewhere, that used a higher graphic resolution in Gr. 0 or Gr. 8
and also provided some animation (not only text, but also graphics),
alas I don`t remember the name of that demo...;
- the ultra-rare 1090XL box and probably graphic cards for it (who-ever
owns this item, doesn't use it, who-ever would like to have + use it,
doesn't own it or cannot afford it!);
- more seriously: Antic and GTIA upgrade by Chuck Steinman. Afaik, an
article about that topic appeared in Atari Classic, since I do not own
it, I can merely speculate that it adds a second Antic and GTIA for
higher resolution and/or more colours...;
- many selfmade upgrades, using graphic chips or graphic cards from other
computers...

Subject: 6.15) What types of memory upgrades are there for the Atari?

This section by Andreas Magenheimer.

Just a short overview here, for a more detailed description (table), see
also 8.10 kinds of atari ramdisks (and 8.11 + 8.12 for programs that
support or require a ramdisk). The following memory enhancements do exist:
- Atari 400/800: ramdisks on memory boards, that fit into the normal
Atari 800 memory slots (Axlon and Mosaic types);
- Atari XL/XE: a) internal memory enhancements:
- piggy-back versions,
- professionel PCB versions,
- SIMM-module versions;
b) external memory enhancements:
- via XL-Parallel-Bus,
- via XE-Cart.port+ECI,
- Flash-ROM cart. versions,
- other Cartridge versions,
- RAM-Card versions,
- SIO-cartridge versions,
- ...
Note that many of these XL/XE memory enhancements are just hobbyist or
selfmade-projects. Most versions which use newer PC technologies
(Flash-ROM cart., RAM-Card, SIO-cart., etc.) are still under development!

Subject: 6.16) What networking hardware is there for the Atari?

This section by Andreas Magenheimer.

In the late 80`s and early 90`s an american "firm" called Dataque
developed some networking-computer-hardware to link two or more Ataris
together, so that multiplayer games are possible, where each user has
its own computer and tv/monitor screen. The hardware was/is computer
independant and will run fine on any Atari 8Bit computer (whereas most
software for it will only work on XL/XE computers). During a 3-4 year
period of development two different hardware add-ons were developed:

a) Gamelink-1: This hardware was developed in 1989/90. It links two
computers together via the joystick ports. It is limited to a maximum
of 2 computers and thus 2 or 6 players, meaning one free port per
XL/XE computer and 3 free ports per 400/800 computer. However, the
few existing games for this hardware merely support 2 players, no
matter, which computer you have...

b) Gamelink-2: This hardware was developed in 1991/92. It links 2 to 8
computers together via the SIO-port. One computer will then act as
the master and has to boot up the software (from tape, disk, harddisk,
etc.) first. Then all other "slave" computers connect to it and boot
off of this master computer (one after another of course). In Europe
we call this device "Multilink", mostly because of the games written
by Bewesoft (Jiri Bernasek) called Multi-Dash, Multi-Race, Multi-Worms.
A two-computer link-network can easily be done with one SIO cable, just
open the end of the SIO cable and exchange cables number 3 and 5. You
now have an easy two-computer (2-4 players) network-cable.

For some available software, that supports this networking-computer
hardware, see 8.16 which programs support networking computer hardware...

Subject: 6.17) Can I attach an ISA card to the Atari?

Yes, RoBu (Roland Buhler) of the Stuttgart ABBUC Regional Group has produced
project plans for an ISA-Bus Interface for Atari 800XL/130XE Computer, ARGS.
http://www.stud.uni-karlsruhe.de/~un55/Hardware/ISA-Interface/ReadME.html

Carsten Strotmann has released sourcecode showing how to access a Hercules
video card with the ISA-Bus Interface.
http://www.strotmann.de/twiki/bin/view/APG/PgmFardwDriverHerc

----

Subject: 7.1) What versions of the Atari Operating System (OS) are there?

Most of this section by permission from:
http://www.student.kun.nl/f.offenga/atari.htm or
http://members.chello.nl/taf.offenga/atari.htm

Atari 8-bit Operating Systems
~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Version 3.3, 6/27/1999.
By Freddy Offenga (taf.offenga [at] chello.nl (replace " [at] " with "@")

400/800 10kB OS roms
~~~~~~~~~~~~~~~~~~~~

Rev.	TV	Date	CRC-32	Part Nr(s)
A	NTSC	(?)	(?)	(?)
A	PAL	(?)	0x72b3fed4	CO15199, CO15299, CO12399B
B	NTSC	(?)	0x0e86d61d	CO12499B, CO14599B, 12399B
B	PAL	(?)	(?)	(?)

XL/XE 16kB OS roms
~~~~~~~~~~~~~~~~~~

Rev.	System	Date	CRC-32	Part Nr(s)
10	1200XL	10/26/1982	0xc5c11546	CO60616A, CO60617A

1	600XL	03/11/1983	0x643bcc98	CO62024
2	XL/XE	05/10/1983	0x1f9cd270	CO61598B
3	800XE	03/01/1985	0x29f133f7	C300717
4	XEGS	05/07/1987	0x1eaf4002	C101687

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.
james adds (3/8/01):
Did exist! My parents bought me an Atari 400 w/ 410 back in 1981 for
entertainment when I was badly injured in a motorcycle accident. A
year or so later I paid good money ($40 USD or so?) to have the OS A
upgraded to OS B.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.

400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.
'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between

these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:
http://www.savetz.com/vintagecomputers/arabic65xe/

Rev. Found in Size CRC-32 Date
~~~~ ~~~~~~~~ ~~~~~ ~~~~~~~~~~ ~~~~~~~~~~

~~~~~~~
Special thanks to Nir Dary for the rev.2 source code, rom dumps and
the 1200XL. It's in good hands.

~~~~~~
More info on what is maybe either the 1985 or 1987 XL/XE OS versions listed
above. From ST*ZMAGAZINE #36, Sept. 1, 1989 (as reprinted in PSAN Nov 89):
by Mark Elliot, Innovative Concepts
The following changes have been incorporated in the 130XE computer.

The O.S. has minor changes like:
A) The MEMORY TEST (from SELF TESTS) tests the extra 64K now! (in 4 squares)
B) Also, the MEMORY TEST checks the first 48K over TWICE as fast as before!
C) The KEYBOARD TEST has the F1-F4 keys missing on top. (function keys),
although the code that interprets them is probably there (like XEGS).
D) Also, it types out "COPYRIGHT 1985 ATARI" at the keyboard test, when all
tests are done. (compared to COPYRIGHT 1983 ATARI, before)
E) And, the O.S. chip itself, is on a 27256 EPROM, but only half of it is
used! (comprared to the original, which was on a 16K x 8 ROM, 27128 comp.
~~~~~~

Subject: 7.2) What is the ATASCII character set?

ASCII is an acronym for the American Standard Code for Information
Interchange. Pronounced ask-ee, ASCII is a code for representing English
characters as numbers, with each letter assigned a number from 0 to 127. For
~~~~~~

example, the ASCII code for uppercase M is 77. Most computers use ASCII codes to represent text, which makes it possible to transfer data from one computer to another.

The 8-bit Atari computers use a modified version of the ASCII character set called Atari ASCII, or ATASCII.

David Moeser produced this nice translation table.
Piotr Fusik corrected the description of Atari character 5.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)

Subject: 7.3) What is Atari BASIC?

BASIC is an acronym for Beginner's All-purpose Symbolic Instruction Code. Developed by John Kemeney and Thomas Kurtz in the mid 1960s at Dartmouth College, BASIC is one of the earliest and simplest high-level programming languages, incorporating components of FORTRAN and ALGOL.

In 1978 Atari contracted with Shepardson Microsystems, Inc (SMI) to create a version of BASIC for their upcoming home computers. The following worked together on the project, which resulted in Atari BASIC:

Paul Laughton (author of Apple DOS) - project leader, co-primary contributor
Kathleen O'Brien - co-primary contributor
Bill Wilkinson - floating point scheme design
Paul Krasno - implemented the math library routines following guidelines supplied by Fred Ruckdeschel (author of the acclaimed text, BASIC Scientific Subroutines)
Bob Shepardson - Modified IMP-16 Assembler to accept special syntax tables Paul invented
Mike Peters - keypuncher/computer operator/junior programmer/troubleshooter

Three Revisions of Atari BASIC were produced: A, B, and C:
A - cartridge produced for use with the 400/800/1200XL
B - built-in to the 600XL/800XL, also produced on cartridge

C - built-in to the 800XL(late models)/65XE/130XE/800XE/XE Game System,
also produced on cartridge.

In order to find out what version you are running, at the READY prompt,
enter "? PEEK(43234)"

If the result is: You have Revision: Atari Part#:
162 A CO12402/CO14502
96 B CO60302A
234 C CO24947A

On versions A, B, and C, Greg Miller writes:
"Rev A had a number of bugs, not just the commonly described crash bug.
Rev B fixed most (maybe all, I don't remember) of these, but in the
process, they added a new bug. You see, the crashes were caused by a bug
in one of OSS's memory move routines. When the bug was fixed, the fix
mistakenly applied to a routine that actually worked in Rev A, causing the
new lockup problem.

Rev C differs in only a few bytes. AFAIK, the only change was to remove
the alteration made to the routine that was broken by Rev B.

Also concerning versions A, B and C, Russ Gilbert writes (3 Jul 2002):
"I've got an opinion on this, my opinion is wrong to 95% of Atari users.

B is a re-compile of A. C is a 12 byte patch to B.

I've used Atari BASIC for a millenium (?). B has less hangs and
ridiculous stuff like losing DIMs and stuff. C hangs like a lot. I must
admit I don't have very much experience with C as I go back to B after
using C for a short time.

I prefer B. I know its foibles. Just LIST, NEW, ENTER, SAVE every 5 or
6 SAVEs. Also, 0 REM will help with ENTERs that aren't working (put a
immediate 0 REM line before you ENTER.)"

Subject: 7.4) What are Atari DOS 1, DOS 2.0S, DOS 3, DOS 2.5, and DOS XE?

Here are short descriptions of the various Disk Operating Systems (DOS)
versions produced by Atari for use with their 8-bit computers.

The original Atari DOS shipped with all 810 disk drives from 1979-1981. It
consists of a single file, DOS.SYS, which is loaded into memory from disk on
startup.
At the top of the menu screen it reads:
DISK OPERATING SYSTEM 9/24/79
COPYRIGHT 1979 ATARI
Unless you are a collector, you probably have no reason to work with DOS 1.
Trivia: The "N. DEFINE DEVICE" menu option does not work.
The DOS 1 disk is labeled: Atari 810 Master Diskette (CX8101).

DOS II Version 2.0S was shipped with all 810 disk drives, and early 1050 disk drives, from 1981-1983. It consists of two files:
- DOS.SYS is loaded into memory from disk on startup
- DUP.SYS, which contains the DOS menu, is loaded only when needed.
MEM.SAV can be employed to preserve the contents of memory to disk when DUP.SYS is loaded, so that the data can be restored to memory when exiting from the DOS menu. DOS 2.0S supports Atari's proprietary single-sided, single density 90K 5.25" floppy disk format only. DOS 2.0S represents the lowest common denominator of Atari DOS versions--you can be assured than any Atari disk drive for the 8-bit Atari can work with disks formatted with DOS 2.0S. DOS 2.0S can read disks written with DOS 1; the reverse is not the case. The DOS 2.0S disk is labeled: Atari 810 Master Diskette II (CX8104).

DOS II Version 2.0D was shipped with the rare Atari 815 Dual Disk Drive. Supports double-density disk drives; also supports single-density disk drives. The DOS 2.0D disk is labeled: Atari 815 Master Diskette (CX8201).

DOS 3 shipped with 1050 disk drives from 1983-1985. It was created in part to take advantage of the 1050's Dual-Density capability, by employing a single-sided, enhanced-density 128K 5.25" floppy disk drive format. Atari called this format "dual-density," but the Atari community quickly came to refer to this format as "enhanced-density" to better differentiate it from widely available 3rd-party truly double density disk drives and supporting versions of DOS. DOS 3 uses a disk format incompatible with DOS 2.0S. It included a utility to convert files from DOS 2.0S to DOS 3, but not back again. It used disk space less efficiently than DOS 2.0S. For these reasons and others, DOS 3 was not widely accepted by the Atari community, and like DOS 1 is not generally used except for curiosity's sake. The DOS 3 disk is labeled: Master Diskette 3 (DX5052).

DOS II Version 2.5 shipped with 1050 disk drives and early XF551 disk drives from 1985-1988. DOS 2.5 represented Atari's relenting to the masses, returning to DOS 2.0S compatability. DOS 2.5 very closely resembles DOS 2.0S, with just a few features added. It supports both DOS 2.0S single-density 90K formats, as well as an enhanced density 128K format for use with the 1050 disk drive. DOS 2.5 also includes a RAMdisk utility for use with the 128K 130XE computer, a utility to convert files from DOS 3 disks back to DOS 2.5, and other disk utilities. DOS 2.5 is just about as universal among Atari users as DOS 2.0S.

DOS XE shipped with XF551 disk drives from 1988-1992. Like DOS 3, DOS XE introduced a whole new format for Atari floppy disks; but unlike DOS 3, DOS XE also preserved general compatability with DOS 2.0S/2.5. DOS XE supports the full capabilities of the double-sided, double density 360K per 5.25" floppy disk XF551 disk drive, including that drive's high-speed burst mode. DOS XE also fully supports the 90K SS/SD capability of the 810 disk drive, the 128K SS/ED capability of the 1050 disk drive, the 180K SS/DD capability of most 3rd-party disk drives for the Atari, and a RAMdisk for use with the 130XE. Date-stamping of files is supported. DOS XE requires an XL or XE computer; it is not compatable with the 400/800 computer models. Even though DOS XE was critically well-received, and represented a substantial jump in capabilities over DOS 2.5, its arrival came so late in the crouded realm of Atari and 3rd-

party DOS versions that it never achieved much acceptance among real users, and is now relegated to the same status as DOS 1 and DOS 3 before it. Before its release, DOS XE was widely known as "ADOS."

Subject: 7.5) What are MyDOS, SpartaDOS, and other popular DOS versions?

Section includes contributions by Andreas Magenheimer (most DOS 2 clone descriptions).

Atari DOS versions are very popular, but many 3rd-party DOS versions have also been developed over the years. Of these, MyDOS and SpartaDOS seem to be the most-used today.

MyDOS 4.53
==========
MyDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support, along with many other "high-end" features.

MyDOS 4.53/3 was released as freeware by David R. Eichel on 1/1/90. Defaults to a 3 character file length/free sector count instead of MyDOS's normal 4. Supports multiple AUTORUNs at boot up (*.AR0 through *.AR9). Supports Axlon RAMdisks.

MyDOS 4.53/4 is the same as 4.53/3, but uses a minimum of four characters in the sector count just like most versions of MyDOS.

MYDOS 4.51 was developed by Wordmark Systems (Charles Marslett). Source code is available as "abandonware" at: http://www.wordmark.org/

MYDOS 4.50 was released on 11/28/88, developed by C. Marslett & R. Puff
http://www.nleaudio.com/css/files/MYDOS45M.ARC

Mathy van Nisselroy's MyDOS page:
http://www-users.rwth-aachen.de/mathy.van_nisselroy/mydos.htm

SpartaDOS 3.2, 3.3, X (4.22)
============================
SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MyDOS disks.

There are many versions available. Hopefully this list will help keep them all straight.

SpartaDOS X (SDX) cartridge

Greatly enhanced/expanded compared to disk- based SpartaDOS; completely different source code. Several versions produced:
4.22 11-05-95 released by Fine Tooned Engineering (FTe)
4.21 7-10-89 released by ICD
4.20 2-06-89 released by ICD
4.19 1-16-89 released by ICD
4.18 10-29-88 released by ICD

4.17 ?-?-88 released by ICD

SpartaDOS Pro 3.3a, 3.3b, and 3.3c - 1994-

The SpartaDOS Pro 3.3 versions were developed by Stephen J. Carden, based upon a dissembled copy of the older (more stable?) 3.2c release from ICD.
-- SpartaDOS Pro Ver 3.3a 3-Nov-94 -- Added MUX support and MS-DOS Commands. Highspeed SIO routines NOT included. Recommended for use in emulators (especially Xformer) only.
-- SpartaDOS Pro Ver 3.3b 25-Dec-95 -- Has two different SIOV handlers, one for the MUX and one for the MIO.
-- SpartaDOS Pro Ver 3.3c 1995 -- Looks at your system and by checking it determines what CIO handler to load, and has MS-DOS command set. Black Box, MUX, and MIO are fully supported, though none of these are required.
-- SpartaDOS Pro Ver 3.3c 19-Dec-97 -- the same 3.3c produced on a 16K ROM cartridge by Video 61.
-- SpartaDOS Pro Ver 3.3d -- exists, but is not in general release

According to Lance Ringquist:
K-Products contracted FTe to develop SpartaDOS Pro 3.3 for exclusive use and distribution with K-Products' BBS Express! Pro, to provide this BBS system with the most stable platform possible. As Video 61 now owns the rights to BBS Express! Pro, SpartaDOS Pro 3.3 is therefore now a product of Video 61.

According to Stephen Carden:
The SpartaDOS Pro 3.3 versions were never owned by K-Products, and are technically shareware owned by FTe, although FTe had no connection with the specific development of the 3.3 versions.

SpartaDOS 3.2g and 3.2gx - Dated 6/4/94.

Last official disk-based versions, released as shareware by Fine Tooned Engineering (FTe), who had purchased the rights from ICD. 3.2g is the primary version; 3.2gx differs only in that it locates the disk buffers under the OS to save RAM. 3.2gx is intended for use in systems that include a PBI device (MIO, Black Box); it is not compatible with BASIC XE or any other programs using RAM under the OS.

First shareware release from FTe: 3.2f.

Earlier major releases from the original developer, ICD: 3.2d, 3.2c, 2.3, 1.1

Only the SDX cartridges and the original version 1.1 are compatible with the 400/800 computer models; SpartaDOS 2.x, and 3.x require an XL/XE.

Many disk-based SpartaDOS versions are available for download here, Thunderdome, kept by SysOp Fox-1:
http://www7.brinkster.com/atari/ataridl/sdsys.htm

One source of SpartaDOS documentation is Russ Gilbert's page at:
http://my.en.com/~russg/

BW-DOS 1.30 and BW-DOS Update #2 - Released: 12/95 ("BeWe")
==========
Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek. (it is pronounced "Bay Vay Dos") which is SpartaDOS compatible. Does not use any speeder internally, but comes with external XF551 speeder. Supports 4 drives and Ramdisk, comes with Ramdisk driver for XE compatible Ramdisks up to 1Megabyte; supports 4 densities: a) Single (90k), b) Enhanced/Medium (130k), c) Double (180k) and d) DSDD (360k); does not use any RAM under OS ROM; unlike SpartaDOS most commands are external, thus the DOS is only 5kbytes short; supports a PAL clock (made by ABBUC regional group "ARGS"); comes with many great utilities (which can also be used with SpartaDOS); paper printed German and disk printed English docs are avaiable; latest version 1.3 is avaiable as Freeware...

The other DOS varieties mentioned below are all, like MyDOS, Atari DOS-2 clones and thus DOS-2 compatible; avaiable as PD or Freeware...

TOP-DOS 1.5+
==========
Carolyn Hoglin writes:
This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed to do that on drive 1.) Also supported are large ramdisks for Axlon, Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an excellent manual explaining how to use its powerful capabilities.

SuperDOS 5.1
==========
supports 4 formats SD/ED/DD/DSDD; supports 256k Xtra RAM/RD; supports 4 speeders: Happy+Speedy+XF551+US Doubler and its compatibles; has an AUX.SYS file with option to use / not use RAM under OS ROM; has unfortunately a very slow Ramdisk;

BiboDOS 5.4 and 6.4
==========
3 versions avaiable, one without speeder - 5.4NT, one with Happy/Speedy support 5.4HS and one with XF support 6.4XF; supports 4 formats / up to 360k; supports 256k Xtra Ram / RD; the DUP.SYS uses RAM under OS ROM, thus Turbo-BASIC must load without DUP;

Turbo-DOS 2.1
==========
Master-Disk produces 4 different versions: 2.1NT without speeders, 2.1HS for Happy/Speedy, 2.1XF for XF551 and 2.1EX for 3 speeders: Happy+Speedy+XF551; supports 256k Xtra RAM / RD and supports use of batchfiles; has converter for DOS 3 and DOS 4; supports 4 formats, up to 360k; does not use RAM under OS ROM; DUP uses a Command Processor; all commands are avaiable via HELP key; works with XL/XE computers only, does not load/boot on Atari 400/800 no clue why;

Subject: 7.6) How do I modify Atari DOS to support more than two drives?

Russ Gilbert writes:

DOS 2 type DOSes default to two drives.
Boot DOS and BASIC.
? PEEK(1802)
if it is 3 then you only recognize two drives.
To get the 3rd drive, poke 1802,7. Then go to dup.sys (type DOS)
and write system files. Next time you boot that DOS, you'll recognize
3 drives.
If you want four drives, poke 1802,15.

Subject: 7.7) Are there Graphical User Interfaces (GUIs) for the Atari?

Contributors: Andreas Magenheimer, Mathy van Nisselroy, Kathleen Ferrante

- Diamond GOS version 1 (a cart and a PD demo-disk-version do exist), version 2 (cart only), version 3 (cart only); plus some applications (painter program, text program, etc.); Diamond GOS has been made freeware by the author Alan Reeve;

- G.O.S., the Graphic operating system by Total Control systems; two different versions are avaiable (I call them GOS 1 and GOS 2) and they are PD;

- G.O.E., the Graphic Operating Environment also by Total Control Systems (this one merely works under Sparta DOS, not with Bewe-DOS and not at all with DOS 2.x); so far I have found 3 different versions (GOE 1,2,3) with some applications (graphic/painting program, etc.); PD;

- S.A.M., the Screen Aided Management (unfortunately it has the same name as SAM, the software aided mouth) from PPP/Germany. It is avaiable in two different versions: a) the type-in listing from Atari magazin and/or the Lazy finger disks (which are PD!) or b) the commercial version 2.0 which has many add-ons and can still be bought from Dean Garaghty/UK or PD-World-Versand/Germany; This GUI merely works correct under DOS 2.5 and Medium/dual density, however...

- BOSS-XL, the XL-Desktop from Mirko Sobe; written in Turbo-BASIC; freeware; http://www.atarixle.de/

- BOSS-XE, the XE-Desktop from Mirko Sobe; written in Turbo-BASIC;freeware, http://www.atarixle.de/

- BOSS-X the newest desktop version from Mirko Sobe, needs an 128k+ Computer (128k or more memory), supports MyDOS up to 16MB and MyDOS subdirs...; still written in Turbo-BASIC; many applications and drivers; freeware; http://www.atarixle.de/

- XL-TOS a small and "cheap" GUI version from Atari magazin (i.e. a type-in listing; the BASIC file, which consists of many data lines creates a short object code file); unfortunately this GUI only looks good, it loads almost nothing... PD;

- ST-TOS a small BASIC program, that looks like a GUI; it can merely load BASIC files and do a few DOS commands, like lock, unlock, delete and such... (PD)

- BASIC desktop, a GUI written in BASIC just as a sample, what can be done with an 8-bit computer; this one loads BASIC and text files (maybe also ML files); PD;

- DCS, the desktop construction set from Tom Hunt; there are 3 different versions avaiable, a) for DOS 2.5, b) for MyDOS andc) for Sparta-DOS; I have tested the Sparta DOS version, which worked with batchfiles and could easily load some ML files, text files and BASIC files (which were already on the DCS disk); it also works with high densities and/or hard disk partitions up to 16MB and supports subdirs of course; hmm, freeware or shareware ?!?

- ATOS - GUI by Tom Hunt/Closer To Home. http://cth.dtdns.net/atos/
1) Lets you use any demo or intro as a screen saver!!
2) Works with all Atari hardware, BB, MIO and Hard drives, SpartaDOS support
3) Lets you run files like full games and demos and then
return back to the desktop. It uses Overlays.

- Atari Desktop by ABC software (Poland), includes editors, converters, file copiers, sector copy, tape+turbo tape copy, small games, CMC finder and player and much much more; works with 64k RAM and keyboard input; disk manuals only in polish language...

- Windows XL a Turbo-BASIC GUI with some nice add-ons, like calculator, editor and other things. written in 1986-1988 by Joerg Forg.

- there are a lot more GUI programs, however many of them are written in BASIC or Turbo BASIC and are very restricted; most of them merely look like a GUI but need to much memory for everyday use. Thats why most users still prefer those DOS or Gamedos (Gameloader, Multiloader, etc.) programs...

Subject: 7.8) What should I know about modem device handlers?

In order to use a modem on the Atari, a modem software handler, or R: device handler, must be loaded into memory.

There are several families of R: handlers, corresponding to the different ways in which a modem may be attached to the Atari.

Except for family #7 below, these handlers are used in one of two ways. Either they are (A) loaded into memory from DOS just before running the main terminal application, or (B) the terminal program is appended to the handler, so that in practice, a single file is loaded from DOS which contains both the R: device handler and the application itself.

1) 835/1030/XM301 modems. Atari-only modems, interface via SIO

2) MPP/Supra modems. Atari-only modems, interface via joystick port

3) R-Verter cable. Connect standard Hayes-type modems via SIO
/ SX212 modem. A Hayes-compatible modem, interface via SIO

4) SWP ATR8000 interface. Standard Hayes-type RS232 modems via this interface.

Richard Anderson writes (Oct 2 02):
Mine originally came with a driver program; and, I believe, a BASIC program
to set up the driver from BASIC. Later they shipped with a special version
of MyDOS with the R: handler built in.

5) 850 Interface/P:R: Connection, internal

This type of "mini handler" simply loads the R: device handler code from a ROM
chip inside the RS232 serial interface. A long beep is heard through the
speaker when the handler is loaded into the computer's RAM.

Many varieties of DOS for the Atari include an explicit provision for loading
this type of R: handler into memory from the 850 or compatible interface.

Also, this type of R: handler is automatically loaded when any 8-bit Atari
computer is turned on with a P:R: Connection or powered 850 connected, but no
powered disk drive is present.

6) 850 Interface/P:R: Connection, external

Used with the 850/P:R: Connection in place of these interfaces' built-in
handlers.

7) MIO/Black Box interfaces, internal

These interfaces utilitize the PBI or ECI parallel ports on the Atari. They
include their own R: handlers in ROM, using no computer RAM at all.

8) MIO/Black Box interfaces, external: Len Spencer's Hyperspeed

This handler is "optional" for the Black Box, but "essential" for the MIO
in order to take full advantage of the high-speed hardware handshaking
capabilities of these two interfaces.

Hyperspd.arc is available at http://members.aol.com/lenspencer/atari8.htm

----

Subject: 8.1) What programming languages are available for the Atari?

This section is by Freddy Offenga.

Revision : 1.9
Date.... : 2004-3-30

==
The goal is to give information about all available languages
for the Atari 8-bit computer. This information includes:
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Maintainer: Freddy Offenga
Email : taf.offenga [at] chello.nl (replace " [at] " with "@")
URL : http://members.chello.nl/taf.offenga/atari.htm

==========

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language titel (medium)
version, year : version, year
author/company : author/company
available..... : where/how to get it
package....... : programs, documentation
features...... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Credits
=======
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup
- umich (University of Michigan Atari archive)
- David Wyn Davies (PL65)
- Kevin Savetz (APX titles)
- Maury Markowitz
- Michael Current
- JT (ValForth)
- Andreas Magenheimer
- Winston Smith
- Carsten Strotmann

Revision history
================

1.9
- X-Assembler updated
- Added "QS FORTH" info from Winston Smith
- Added FORTH section work from Michael Current (thanks to Carsten Strotmann)
(see also: http://www.strotmann.de/twiki/bin/view/APG/LangForth)
- Several updates in the assembler section

1.8
Thanks to Adreas Magenheimer for these updates:
- Added "Mesa-Forth"
- Added "130XE Assembler 4.32"
- Updated "SynAssembler"

1.7
Thanks to Maury Markowitz for these updates:
- Updated "A BASIC Compiler"
- Added "Der BASIC Compiler", "MMG BASIC Compiler"
- Added "Frost BASIC", "TT-BASIC XL"

1.6
Synchronized with Atari 8-bit FAQ May-2002 :
- Added "X-Assembler"
- Added "CTH Fast Basic"
- Added availability for "Deep Blue C"
- Added availability for "Atari Pascal"
- Ignored changes "Kyan Pascal" (need more info)
- Updated "ValForth"
- Updated "Extended fig-Forth"
- Updated "fun-Forth"
- Added "Extended WSFN"
- Removed e-mail addresses
- Added availability for "A65"
- Updated "PL65"

1.0 .. 1.5
Changes not noted.
Old versions are available on request.

a) ASSEMBLER

- 130XE Makro Assembler (disk)
version, year : 4.32, ?
author/company : Torsten Karwoth
available..... : freeware, ABBUC PD #297
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
Two pass 6502 assembler with integrated menu, editor
and monitor shell for 128KB RAM Ataris. Source format
is derived from Atmas Makroassembler.

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ABBUC PD #368
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
New version with 128KB - 1088KB RAM support.
Two pass 6502 assembler with integrated menu, editor

and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : abandonware, http://www.wordmark.org/
package..... : assembler, manual
features..... : source include
Two pass 6502 assembler. Source format is based on the
Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?
package..... : assembler, docs
features..... : source include
Two pass 6502/65816 assembler.

- Assi (download)
version, year : 0.0.41, 2000
author/company : MacFalkner
available..... : http://members.aol.com/macfalkner/atariindex.htm
package..... : assembler, file linker
features..... : source include, data include, code relocation
Cross assembler for Win32. Source code is highly compatible with
Atmas for the Atari.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk)
version, year : 1.0C, 1981
author/company : Atari, APX
available..... : ?
package..... : assembler, editor, debugger, manual
features..... : macros, source include
Two pass 6502 assembler.

- ATasm (disk)
version, year : 0.92, 1999
author/company : Mark Schmelzenbach
available..... : umich
package..... : assembler
features..... : macros, source include, optionally target .XFD
disk images and machine state files (Atari800 / Atari800Win),

conditional assembly. Two pass 6502 portable cross assembler.
Highly compatible with MAC/65.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros
Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : 1.0, 13/12/1986
author/company : E.Reuss, Compy-shop
available..... : ?
package..... : assembler, editor, monitor
features..... : source include, data include
Two pass 6502/65c02 assembler with integrated editor/
monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package..... : assembler, editor, menu, manual
features..... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package..... : assembler, editor, monitor
features..... : ?
Two pass 6502 assembler with integrated editor/monitor.

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package..... : assembler, editor, disassembler
features..... : ?

- Kasm65 (disk)
version, year : 2.51, 1997
author/company : Ken Siders
available..... : shareware, umich
package..... : assembler, editor, linker, docs
features..... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from

the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 1.01, 1984
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : ?
features..... : ?

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.
Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAC/65 Macro Assembler (disk)
version, year : 4.20, 1994
author/company : Stephen D. Lawrow, Fine Tooned Engineering
available..... : ?
package..... : ?
features..... : ?

- MAC/65 Macro Assembler (disk)
version, year : 4.20 demo version, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : ?
features..... : ?

- MAE (disk)
version, year : .96, 1996
author/company : John Harris
available..... : umich
package..... : assembler, menu, editor, monitor, docs
features..... : macros, source include, data include,
conditional assembly
Two pass 6502/65816 assembler with integrated editor/
monitor. Extra RAM supported.

- NASM65 (disk)
version, year : ?, 1992
author/company : Nat!
available..... : ?
package..... : assembler, linker, librarian
features..... : macros, relocation, source include
One pass 6502 portable cross assembler (initially for
the ST). Highly compatible with MAC/65.

- PC-65 (disk)
version, year : 1.0 beta, 1996
author/company : Jan Feenstra & Freddy Offenga
available..... : -
package..... : assembler
features..... : macros, source include, data include,
boundary directive
Two pass 6502 cross assembler for PC/DOS. The source
format is highly compatible with the ST-65 assembler.

- Quick Assembler (disk)
version, year : 1.0, 1990?
author/company : JBW, Avalon?
available..... : ?
package..... : assembler, editor, menu, debugger
features..... : source include
Two pass 6502 cross assembler with integrated editor.
Very user friendly menu environment.

- Ra65 (disk)
version, year : 1.0, 1989
author/company : John R. Dunning
available..... : public domain, umich
package..... : assembler, linker, librarian
part of cc65 (c-compiler)
features..... : ?

- Synassembler (disk|cart)
version, year : 4.0, 1982
author/company : Steve Hales, Synapse Soft
available..... : http://www.atariland.com/members/oldatarian/
package..... : assembler, editor, monitor, manual
features..... : source include
Two pass 6502 assembler.
An Adaptation by Steve Hales of the S.C. Assembler II.

- ST-65 (disk)
version, year : ?, 1991
author/company : A. Stauffenberg, F. Offenga
available..... : -
package..... : assembler, menu shell, manual
features..... : macros, conditional assembly,
source include, data include,
boundary directive
Two pass 6502/65c02 cross assembler for the Atari ST
written in 68000 assembly. As far as I know this is
the first assembler with the boundary directive.

- Xasm
version, year : 2.5.2, 2002
author/company : Piotr Fusik
available..... : http://xasm.atari.org
package..... : assembler, docs

features..... : conditional assembly, source include,
binary include, pseudo commands,
pseudo addressing modes
Two pass 6502 cross assembler for PC/DOS. The source
format is backward compatible with Quick Assembler.

b) BASIC

- A BASIC Compiler (?)
version, year : 1.05, 1987
author/company : Monarch Data Systems
available..... : ?
package..... : BASIC compiler
features..... : ?

- Advan BASIC (disk)
version, year : ?, ?
author/company : Advan Language Designs
available..... : ?
package..... : BASIC compiler
features..... : ?

- Atari 800 Basic (disk)
version, year : 1.0, 1981
author/company : Microsoft
available..... : ?
package..... : ?
features..... : ?

- Atari BASIC (cart)
version, year : Rev.C, 1983
author/company : Atari
available..... : standard ROM in Atari XL/XE
package..... : BASIC interpreter, manual
features..... : pretty plain BASIC implementation

- Atari Microsoft BASIC II (cart)
version, year : ?, 1991
author/company : Atari
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC A+ (disk)
version, year : 3.05, 1981
author/company : OSS
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC XL (cart)
version, year : ?, ?
author/company : OSS

available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XE (cart)
version, year : ?, 1985
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- CTH Fast Basic (disk)
version/year : ?
author/company : Tom Hunt/Closer to Home
avaiable.......: PD, Freeware or Shareware;
package........: language plus several test files
and examples; english docs;
features.......: faster than Atari Basic, not much
slower than TB, does not use Ram under OS;
avaiable at Tom Hunt's homepage or elsewhere...

- Der BASIC Compiler (?)
version, year : ?, 1983
author/company : Datasoft
available..... : ?
package....... : BASIC compiler
features...... : ?

- Frost BASIC (?)
version, year : 1.04, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler
features...... : ?
Version of Turbo Basic XL that runs on 48k machines (400/800).

- MMG BASIC Compiler 2.0 (?)
version, year : 2.0, 1984
author/company : Special Software Systems
available..... : ?
package....... : BASIC compiler
features...... : ?
It appears that this is a newer version of Der BASIC Compiler,
licensed to some other company.

- TT-BASIC XL (disk)
version, year : 2.11, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler
features...... : ?
Published in the German magazine "Happy Computer".

Appears to be a newer version of Turbo Basic XL.

- Turbo Basic XL (disk)
version, year : 1.5, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package..... : BASIC interpreter, compiler (V1.1)
features..... : ?
Published in the German magazine "Happy Computer".

c) C

- ACE C (disk)
version, year : ?
author/company : John Palevich & Ralph Walden
available..... : ?
package..... : ?
features..... : ?
This is a newer version of 'Deep Blue C'.

- C/65 (?)
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
Probably derived from Dr.Dobbs "Small C". Compiles to 6502
code which emulates the 8080 instruction set.

- C65 (?)
version, year : ?
author/company : Keith Ledbetter
available..... : ?
package..... : ?
features..... : good macro assembler
This compiler does not support structs.

- CC65 (disk)
version, year : 1989
author/company : John R. Dunning
available..... : umich archive,
http://www.umich.edu/~archive/atari/8bit/Languages/Cc65/
package..... : compiler, linker, assembler, librarian
features..... : ?
Public domain compiler. Also used as cross compiler.
Relocatable object linkage files, and the most thorough
K&R C for the 8-bit. Comes with an relocatable assembler.

- CC8 (disk)
version, year : 2.3
author/company : John Palevich & Steve Kennedy
available..... : ?

package..... : Compiler
features..... : ?
ACE C with more "real" C support (e.g. arrays of pointers
to structs). Requires ACE C runtime libs and linker.

- Deep Blue C (disk)
version, year : 1.2, 1982
author/company : John Palevich, APX
available..... : http://www.atariarchives.org/APX/showinfo.php?cat=20166
Source code "Deep Blue Secrets" downloadable at
http://www.atariarchives.org/APX/showinfo.php?cat=20179
package..... : Compiler, Linker
features..... : ?
Deep Blue C was originally an independent product, but it
then became available from APX. It converts C to pseudo-
code and then interprets the pseudo code (8080 instruction
set emulation).
Drawn from Ron Cain's public domain C-compiler (Small-C).

- DVC C (disk)
version, year : 1.05, 1985
author/company : Ralph E. Walden
available..... : ?
package..... : Editor, Compiler, Optimizer, Linker
features..... : Quite user friendly program
The compiler generates special object files (.CCC)
which can be optimized and linked. The package uses a
special DOS called DVC DOS which contains runtime stuff.

- LightSpeed C (disk)
version, year : 1.08, 1986
author/company : Clearstar Softechnology
available..... : ?
package..... : Compiler, Optimizer, Linker
features..... : ?
Runs under CLI DOS's and MENU DOS's.

- Tiny-C
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
First sold C compiler by OSS. This compiler was used to
compile itself! First true language "bootstrap" on any
8-bit machine (it was also available for Apple and CP/M
machines). Derived from Dr.Dobbs "Small C". Compiles to
6502 code which emulates the 8080 instruction set.

d) PASCAL

- Atari Pascal (disk)
version, year : 1.0, 1982
author/company : APX
available..... : APX-20102
Information at http://www.atariarchives.org/APX/showinfo.php?cat=20102
package..... : ?
features..... : ?
Needs two drives.

- Draper Pascal (disk)
version, year : 2.1, 1989
author/company : Norm Draper
available..... : ?
package..... : ?
features..... : ?

- Kyan Pascal (disk)
version, year : 1986
author/company : Kyan Software, APX
available..... : ?
package..... : editor, compiler, linker, macro-assembler
and manual
features..... : ?
Kyan Pascal would run off a single floppy. The Atari (APX)
version needs two drives. A version which runs entirely in
128k should be available too.

e) LISP

- INTER-LISP/65 (disk)
version, year : 2.1, 1981
author/company : Special Software Systems, DataSoft
available..... : ?
package..... : ?
features..... : ?

- INTER-LISP/65 (disk)
version, year : 2.2, 1982
author/company : Special Software Systems, DataSoft
available..... : ?
package..... : ?
features..... : ?

f) FORTH

- ES-FORTH
version, year : 1.2, 1984
author/company : The English Software Company
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthESForth
package..... : ?
features..... : ?
Seems to be based on fig-FORTH, but with some unique "Words".

Works with normal DOS.

- Extended fig-FORTH, (disk)
version, year : 11/10/1981
author/company : Patrick Mullarky, APX
available..... : APX-20029
http://www.atariarchives.org/APX/showinfo.php?cat=20029
package..... : ?
features..... : ?

- Extended fig-Forth (disk)
version, year : 1.1 Rev. 2.0, 01/15/82
author/company : Patrick Mullarky, APX
available..... : APX-20029
http://www.atariarchives.org/APX/showinfo.php?cat=20029
package..... : ?
features..... : ?

- fig-FORTH
version, year : 1/26/81 and 4/01/82 releases
author/company : Steven R. Calfee "Team FORTH"
available..... :
http://www.atariarchives.org/APX/showinfo.php?cat=unknown_fig
package..... : ?
features..... : ?

- fig-FORTH
version, year : 4/10/82
author/company : Peter Lipson / Robin Ziegler "Team FORTH"
available..... : ?
package..... : ?
features..... :
based on 4/1/82 release of fig-FORTH by Steve Calfee

- fig-FORTH
version, year : 5/5/82 - 10/16/82
author/company : Harald Striepe "Team FORTH"
available..... : ?
package..... : ?
features..... :
based on 4/10/82 release of fig-FORTH by Lipson/Ziegler

- fig-FORTH, Antic (disk)
version, year : 1.4S REV.H, 18Jun85
author/company : John Stanley/Antic Magazine "Team FORTH"
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthAntic
package..... : ?
features..... :
based on 10/16/82 release of fig-FORTH by Striepe

- fun-Forth (disk)
version, year : ?
author/company : Joel Gluck, APX
available..... : APX-20146
http://www.atariarchives.org/APX/showinfo.php?cat=20146
package..... : ?
features..... : ?

- Grafik-FORTH
version, year : 1990
author/company : RAI Production
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthGraphicForth
package..... : ?
features..... : ?
based on fig-FORTH 1.4S and TURBO-GRAPHICS-SYSTEM 256

- MesaForth
version, year : 12/03/81
author/company : ?
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthMesa
package..... : language, source code, documents, examples
features..... :
based on 6502 fig-Forth. The major difference is in the size of the
screen on disk (512 bytes instead of 1024 bytes).
Runs under ATARI DOS 2.0S.

- QS FORTH
version, year : 1.0, 3/27/81
author/company : James Abanese / [QS] Quality Software
available..... : http://www.strotmann.de/twiki/bin/view/APG/LangForthQS
package..... : Editor, Assembler, I/O routines
Single Density 5.25 Floppy and Manual in Binder
features..... : Editor, Assembler, I/O Routines.
based on fig-FORTH.

- Turbo-4th
version, year : January 1985
author/company : Steven R. Calfee
available..... : ?
package..... : ?
features..... :
compatible with fig-FORTH and Team FORTH. It's fast.
Not threaded, it is a true compiler

- ValForth (disk)
version, year : 1.1, 1982
author/company : Valpar International
available..... : ?
package..... : (8) disks in the set including: 1)master disk,
2)display formatter, 3)text compression and auto text formatting,
4)valDOS-I, 5)valDOS-II, 6)player-missile graphics, character editor and

sound editor, 7)general utilities and video editor, 8) Turtle &
valGraphics and advanced floating point routines.
features..... : ?
based on fig-FORTH

- X-FORTH
version, year : 26 Jan 2003
author/company : Carsten Strotmann
available..... : http://www.strotmann.de/twiki/bin/view/APG/ProjXForth
package..... : binary, source, disk image with samples & editor
features..... : aims to be compatible with new ANSI standard.
works with normal DOS.

g) PILOT

- Atari PILOT (cart)
version, year : 1980
author/company : Atari
available..... : ?
package..... : ?
features..... : ?

h) LOGO

- Atari LOGO (cart)
version, year : 1983
author/company : LCSI, Atari
available..... : ?
package..... : ?
features..... : ?

i) All the rest

- Action! (cart)
version, year : 1983
author/company : OSS
available..... : ?
package..... : compiler, editor, monitor and library
features..... : fast compiler which generates good code
Needs cartridge for runtime procedures. A PD runtime
library is also available.
All variables are static, so recursive routine calls
are not possible. No floating point type (though a
PD library should make this possible). No arrays of
objects (arrays of POINTERS to objects are possible).

- Extended WSFN, WSFN = Which Stands For Nothing
version, year : ?
author/company : Harry Stewart, APX
available..... : APX-20026
package..... : ?
features..... : ?
Info at http://www.atariarchives.org/APX/showinfo.php?cat=20026

- Quick (disk)
version, year : 2.0, 1990
author/company : Raindorf Soft
available..... : ?
package..... : ?
features..... : ?
This is the "poor man's Action!". Same restrictions as
Action! apply also to Quick. Further restrictions are:
only simple assignment expressions, no records and no
pointers.

- PL65 (disk)
version, year : 1.0, 1987
author/company : Noahsoft
available..... : commercial, Extremely rare.
package..... : compiler, editor, library, sample game
features..... : Similar features to Action with same restrictions.
Highly flexible language that includes inline assembler features and
pointers. Robust and well-engineered editor. Does not require
additional runtime library - automatically generated and included in
the compiled code during compilation.

- Test Computer Language (disk)
version, year : 2.2, 1985-1990
author/company : D.Firth
available..... : public domain, ?
package..... : compiler and editor
features..... : ?

Subject: 8.2) What cartridges were released for the Right Slot of the 800?

Contributors: Gene, Larry White, others

Austin Franklin Austin 80 Console Software
Eastern House KISS
Eastern House Monkey Wrench
Eastern House Monkey Wrench II
Geminisoft/Sar-An Magic Dump
Geminisoft Magic Dump II
Radical Systems Cartridge Maker (eprom burner)
Block (first right cart/first "backup" program hardware device)
R-Time 8 ICD (battery-backed clock, for left or right cart slots)
Real Time Cartridge Sunmark, http://www.sunmark.com/

Subject: 8.3) What games support 4 or more simultaneous players?

Contributors to this section: Jeff M Lodoen, Vidar \"Hawk\" Olavesen, Pat
Mulvey, Steven E. Posey (Party Quiz), Andreas Magenheimer, Florian Dingler

a) The following games support 3 simultaneous players:
(2 players via joystick, 1 player via keyboard)

- Dynakillers by GMG/Slovakia (Freeware!)
- Blastermind by Numbercruncher/Germany (Freeware!)
- M.U.L.E. cracked+changed by CSS/Germany (pirate copy!)
- some more PD and commercial games...

b) The following games support 4-joystick head-to-head play:
(Only the 400 and 800 computer models sport 4 controller ports)

- Asteroids cart. by Atari,
- Basketball cart. by Atari,
- Dandy disk by APX,
- M.U.L.E. disk by Electronic Arts,
- Maze War disk or cart. by ???,
- Silicon Warrior disk or tape by Epyx,
- Survivor disk or cart. by Synapse,
- Major League Soccer cart. by Thorn EMI,
- Major League Hockey cart. by Thorn EMI,
- Volleyball by ???
(PD game written in Atari BASIC);
- Tank Battle by Fred Pinho from Antic magazine:
http://www.atarimagazines.com/v3n2/animate.html
- Roadblock by Brian Holness from Compute! magazine
- Battle Room (CIA vs. KGB) a PD game by SNACC
- Aliens a PD-game by ??? using an altered Dandy program
(the Dandy font and thus the graphics were changed, however,
the levels remain the same and can be used in both games);
- Sky Warrior by ??? from ROM magazine, June 1984 ***
- Depth Warrior by ??? from ROM magazine, Aug. 1984 ***
- Yellow-Brick-Road by ??? from ROM magazine, Feb. 1984 ***

*** these programs are reported to be 4-player programs, I'm
not sure if they are meant to be 4-players simultaneously
or 4-players - one after another (try to find out!);

c) The following games support 8 players on the 400/800 or 4 on the other
computer models, using the 2 controllers-per-port CX30 Paddle controllers:

- Super Breakout by Atari,
- Worms? by Electronic Arts
(has nothing to do with the PC game!)

d) The following game supports 4 players on all machines, using special
4-button keypad controllers linked together with RJ-11 jacks (standard
phone jacks) to a box with 2 joystick port connectors:

- PQ: The Party Quiz Game by Suncom

e) The following programs support multi-joystick games, using extra
hardware called Quadrotron (from the german Atari magazin 2/1989):

- test program for 4 joysticks (and assembler source);
- Quadro-Tron by H.Schoenfeld (4-player Tron-clone);

f) The following programs support multi-joystick games, using extra
hardware called Multijoy (multijoy4 for up to 4 players, multijoy8
for up to 8 players and multijoy16 for up to 16 players; originally
developed by Raster/Radek Sterba, but also available from ABBUC):

- Cervi by R.Sterba (up to 8-players Snake-clone);
- Multijoy by R.Sterba (up to 4 players Tetris-clone)
- Bremspunkt by T.Butschke (up to 4 players Car-race);
- Sheeprace by F.Dingler (1 to 8 players Sheep-race);
- Cardgrabber by F.Dingler (2 to 8 players grab-a-card-game);
- Ice-Hockey by F.Dingler (4 to 8 players Icehockey-game);
- Quadrotron-M4 by R.Sterba (patched Quadro-Tron for Multijoy);
- Shoot Em' All by R.Sterba (16 players shooting-game)

Subject: 8.4) What programs run only on the 400 and 800 models, and why?

The following are reported as incompatible with models other than the
original Atari 400/800. Most probably do work on XL/XE's if you use a
translator to run the original 400/800 OS on your XL/XE.

Apple Panic Broderbund
Aquatron Sierra On-Line
Astro Chase (by First Star Software) Parker Bros.
Atari Word Processor Atari
(this is not the same as AtariWriter!)
Atlantis (some versions!) Imagic
Attack at EP-CYG-4 (by Bram) Romox
Bacterion! Kyle Peacock/Tom Hudson/ANALOG#20
(http://www.cyberroach.com/analog/an20/bacterion.htm
patch for XL/XE available:
http://www.cyberroach.com/analog/an20/bacterion_patch.htm)
Bandits Sirius Software
BearJam Chalkboard
Boulders And Bombs CBS
Chicken Synapse
Dancing Feats (by Softsync) Romox
Demon Attack Imagic
Dreadnaught Factor, The Activision
Drelbs Synapse
File Manager 800+ Synapse
Forbidden Forest Cosmi
(later versions by different companies work ok on XL/XE!)
Fort Apocalypse Synapse
(cart version is 400/800 only! tape+disk versions work ok on XL/XE!)
Galahad And The Holy Grail APX
(Downloadable: http://www.atariarchives.org/APX/showinfo.php?cat=20132)
Go Hayden
Gorf Roklan

Jawbreaker II Sierra On-Line
Jet Boot Jack English Software
(can be found on various tapes/disks; at least the re-release
version by Byte Back works alright on XL/XE computers!)
Juggler IDSI
K-Razy Antiks K-Byte
K-razy Kritters CBS
K-razy Kritters K-Byte
Kangaroo Atari prototype
KoalaPainter Koala
Leo's 'Lectric Paintbrush Chalkboard
Leo's Links Chalkboard
Letter Perfect (before v6) LJK
LogicMaster Chalkboard
Mac/65 [ver. 1.00, orange] OSS
Mario Bros. ('83) Atari
Maze Epyx
Micro Illustrator Chalkboard
MicroMaestro Chalkboard
Monkey Wrench Eastern House
Monster Maze Epyx
Ms. Pac-Man Atari
(has problems with newer XE/XEGS computers!)
M.U.L.E.(early release only) Electronic Arts
Nautilus Synapse
Pac-Man Jr. Atari prototype
Picnic Paranoia Synapse
Pool 1.5 IDSI
Pool 400 IDSI
Protector II Synapse
QS Forth James Abanese / [QS] Quality Software
Rack 'Em Up Rocklan
Shamus Synapse
Slime Synapse
Snapper Silicon Valley Systems
Space Dungeon Atari
Squish 'Em Sirius
Super Pac-Man Atari prototype
Synassembler Synapse
Text Wizard Datasoft
Zaxxon (early release only!) Datasoft

Konrad M.Kokoszkiewicz writes:

XL/XE software won't work on 400/800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Andreas Magenheimer adds:

To get an overview or see a chart of OS changes from the 800 to the XL
line, refer to Antic magazine Volume 3, Number 2 (June 1984), pages 10-14;
(online: http://www.atarimagazines.com/v3n2/insideatari.html)
Also note, that some software will not work correct (or not at all) on
newer XE/XEGS versions (which have a new OS with a new version number,
a new selftest/memory-test/keyboard-test, larger RAM chips, etc. etc.);

Thomas Richter contributes further details (16 Jan 2004):

There are a couple of reasons why some games don't run on the XL/XE
models. I try to order them by "likeliness", of course biased by my
personal observations:

i) The printer buffer of the XL Operating System in page 3 is a couple
of bytes shorter. The additional bytes are used for extended OS
variables not available in the 800 series. Most prominent is the $3fa
location, holding a shadow register of GTIA's TRIG3 signal. While a
true joystick trigger line in the 400/800 series, this signal is used
as "cart inserted" signal for XL/XE models. Unfortunately, the OS
compares GTIA trig3 with the shadow register at $3fa in each vertical
blank, running into an endless loop if the register contents don't
match. This causes hangs for games using page 3 either as copy-buffer
or for player-missile graphics. (Hangs by Ms. Pac-Man and
Bacterion! are caused by this, and many others...) This is "fixable"
either by the translator disk, or by a quick hack into the game,
replacing the OS vertical blank or poking TRIG3 frequently into its
shadow. The reason for the OS behaviour might be that Atari wanted to
prevent crashes if the cartridge is inserted or removed while the
machine is running. The 400/800 is powered down when a cart is
inserted, the XL/XE lacks the cover of the older models that triggered
a little switch to interrupt the power line.

ii) Similar to the above, writes to $3f8. This OS equate defines
whether on a warm start, the BASIC ROM shall be mapped back in. If
its contents are altered, a program triggering a reset as part of its
initialization will find itself then with 8K less RAM occupied by
a BASIC ROM, making it crash. Similarly, writes to the cartridge checksum
$3eb could cause a cold-start on a "reset initialization". This is
fixable by the translator disk.

iii) Some games use a four-joystick setup, or at least initialize
PIA itself. If this happens inadequately, PIA Port B, bit 0 gets changed,
disabling the ROM, and thus crashing the machine. This is not fixable
by the translator since it is a hardware issue.

iv) Direct jumps into the OS ROM, not using the documented vectors in
the $e450 area. Interestingly, this fault is not as common as it may
sound since games hardly ever use the OS. It causes failures of
some "serious applications", most notably "QS Forth" and applications
compiled by it. This is fixable by the translator disk.

As a side remark, it is interesting to note that no such documented jump-ins exist for the math-pack ($d800 to $dfff). It is not really part of the OS, but looks more like a part of the BASIC interpreter that didn't make it into the OS because there was no room left. Thus, direct jump-ins have to be used here that are documented in the De Re Atari (for example). Atari never changed them, but it seems likely that this documentation happened more or less as an accident since the same source also lists some mathematics-related jump-ins into the Basic (namely, to compute SIN and COS and related) that are only valid for the Rev. A BASIC. Thus, the math pack might be a couple of routines that have been originally intended for "private use" of the BASIC ROM, but then have been found "too useful" by many others to remain "closed". Otherwise, it is hard to explain why the otherwise pretty cleaned-up OS comes with a construction like this.

Subject: 8.5) What programs make use of the Light Gun or a light pen?

Bertrand M. (LEXX) writes:

- Bug Hunt cart. by Atari;
- Barnyard Blaster cart. by Atari;
- Crossbow cart. by Atari;
- Crimebuster cart. by Atari;
- Operation Blood disk by ANG/Mirage;
- Operation Blood II - Special Forces disk by ANG/Mirage;
- Light Gun Blaster (PD from Page 6);
- enhanced Lightgun Blaster (PD from Pedrokko);
- Gangsterville disk by Linda Soft
(an italian game written in BASIC);
- maybe a couple more...

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4."
This renders much light gun and light pen software unusable on the 400.

Andreas Magenheimer adds:
All Lightgun games can be used with a lightpen (which is not as accurate as a Lightgun however). And all lightpen programs can be used with a lightgun. thus add:

- Atari Graphics cart. by Atari
(a painting/drawing program);
- Matrix a PD game by Dave Oblad
(a 4-wins or 5-wins clone!)
- Alien Invaders disk by R.Gore (available from DGS);
- Bembelwo a PD game by Thorsten Butschke
(a sort of golf/minesweeper game, written in Quick);
- Sharp Shooter by Mat*Rat a PD game from Analog,
(also available on cart from Video 61/Lance Ringquist);
- Lightgun Shooter by ??? from ABBUC mag.
(a simple shooter game, at least PD!)

- Flyshot or Flyshoot a PD game by Kemal Ezcan
(a Turbo BASIC game from ZONG, the KE Soft magazine);
- Geisterschloss game+editor disk by KE Soft;
- Lightpen Doodle by ??? from Antic magazine;
- some more PD programs and utilities for Lightpen or Lightgun;

Subject: 8.6) What programs have a track ball mode or support a mouse?

Contributors: Andreas Magenheimer, Mirko Sobe

Title Keystroke Required
-------------- ---------------------
- Missile Command by Atari CTRL-T
- Slime by Synapse [T]
- Shanghai by Activision choose controller type: ST mouse !
(plug it into port 2; if you do not
have one, you have to reboot!!)
- Bombdown by Roemer of Uno choose between Joystick, Amiga
mouse, ST mouse or CX85 numeric
keypad (use port 2 for any mice)
- Minesweeper by Raindorf-Soft use an ST mouse in port 2
- The Brundles by KE-Soft use an ST mouse in port 2
- The Brundles Editor by KE-Soft, PD use an ST mouse in port 2
- Geisterschloss by KE-Soft, PD choose Lightgun (port 1) or ST
mouse (port 2)
- Vanish (ZONG, Vol. 5+6/1993); use an ST-mouse in port 2
- Hong Kong (ZONG, Vol. 5+6/1993); use an ST-mouse in port 2
- Maus-DOS (ZONG 5+6/1993); use an ST-mouse in port 2
- Faecher-Patience (ZONG 1/1993); use an ST-mouse in port 2
- Macao (Zong 5+6/1994); use an ST-mouse in port 2
- Multi-Mouse manager (PD) drivers for mice, TB, etc.
- Multiplayer 2.1 by Madteam supports ST + Amiga mouse in port A
- Unriagh I (german PD adventure) has drivers for ST mouse+Joystick
(stick=port 1, mouse=port2)
- Unriagh II (german PD adventure) has drivers for ST mouse+joystick
(stick=port 1, mouse=port 2)
- little Calculator (AMC-Verlag, PD) uses ST-mouse only (port 2)
- big UPN calculator (PD) uses ST mouse, TB, Touch tab. and
joystick; (there are different COM
files, rename the one you wish to
use to *.EXE; all drivers use port
1 - if I remember correctly)
- Operation Blood (ANG/Mirage) press mouse fire or Select to start
in ST mouse mode (port 2)
- Operation Blood 2 / Special Forces press mouse fire or Select to start
(ANG/Mirage) in ST mouse mode
- Sprint XL (ABBUC Jahresgabe 1992) uses an ST mouse in port 2
- M.O.S. (ABBUC magazine) uses an ST mouse in port 2
- Diamond GOS (Reeve software) all three versions support an ST

mouse in port 2
- S.A.M. (Power per Post) german GUI, supports an ST mouse in
port 2
- G.O.E. (TCS) supports an ST mouse in port 1
- BOSS-X (MS-Software, Mirko Sobe) supports ST-Mouse in Port 2

RE: Missile Command, Andreas writes:
there are many different versions available... I know the old Atari 800 cart version, which works correct with Joystick and Trakball, but not at all with a mouse. The newer XL version works with Mouse, trackball and Joystick, also the newest (built-in) XEGS version of MC. But, there is also a tape version (and maybe a disk version) of MC available. I am not sure if this tape version behaves like the old 800 version or like the newer XL and XE/XEGS versions...

And about mice, Andreas adds:
Maybe you did not know, there is a little difference between Trackball and ST-mouse. Although MC works with both input devices does not mean, they are the same. they are not !! Connect the TB to an ST computer and you see: it does not work at all !! You have to do a small conversion to convert the TB to an ST mouse. (Plans are avaiable from ABBUC, Germany).

Subject: 8.7) What programs have a paddle(s) or Koala Pad mode?

Andreas Magenheimer contributes:

- Super Breakout (Atari) breakout clone
- Live Wire (Analog) tempest clone
- Live wire 2 (Analog) tempest clone
- Planetary Defense (Analog)
- Pong (Antic) Pong clone
- Pong (Analog) Pong clone
- Super Ball (Compy Shop Magazin) Breakout clone
- Arkanoid (Taito/Imagic) Breakout clone
- Koala/Micro-Illustrator (Island graphics/Koala Ware) graphics program
- Chiseler (Antic or Analog) a breakout clone
- Slime (Synapse) a slimy shooter...
- Chicken (Synapse) catch the chicken eggs...
- One on One (Compute!) a breakout/warlords clone
- Paratroop Attack by David Plotkin
- all Pinballs created with the P.C.S.
(use left paddle trigger for left flipper and right paddle trigger for right flipper; or simply use a joystick and left/right/fire button);
- many more Pong and Breakout clones
(forgot their names, maybe someone can help here!)
- many more programs (which I do not remember right now!)

for Koala Pad only: - Micro-Illustrator / Koala Painter
- other Koala Pad painters or programs

Subject: 8.8) What programs have a CX85 Numerical Keypad mode?

Andreas Magenheimer contributes:

- Bombdown (Roemer of Uno);
- The Bookkeeper (Atari);
- Multi mouse Management (PD);
- UPN calculator (PD);
- Ball Harbour (Zong 8/1992);
- The Big Quest (Zong 7/1992);
- Blob (Zong 2/1992);
- Bomber Jack (KE-Soft);
- Catch (Zong 6/1992);
- Code table (Zong 11+12/1993);
- CX-85-Driver (Zong 7+8/1994);
- CX-85-Keycode-driver (Zong 7+8/1995);
- Donald (by KE-Soft);
- Drag (by KE-Soft);
- Dragon Fire (Zong 1/1993);
- Gravitar (Zong 4/1992);
- Hungry Goblin (Zong 5/1992);
- Invaders (Zong 5+6/1993);
- Joshi (Zong 3+4/1993);
- Lasermaze (by KE-Soft);
- Lost in the Antarctic (Zong 2/1992);
- Mampfman (Zong 8/1992);
- Minipac (Zong 3/1992);
- Minipac 2 (Zong 6/1992);
- Money Raider (Zong 2/1992);
- Monster Tracking (Zong 9/1992);
- Oblitroid (by KE-Soft)
- Pac-Man (Zong 11/1992);
- Schlumpf/Smurf (Zong 5/1992);
- Slurp (Zong 3/1992);
- Techno Ninja (by KE-Soft)
- Transsylvania (Zong 3+4/1993);
- Viro-Mania (Zong 2/1993);
- Zador XL (by KE-Soft)
- Zador II (by KE-Soft)
- many more games from KE-Soft and Powersoft;
(forgot their names, help needed!)

Subject 8.9) What programs have a Touch tablet mode?

Andreas Magenheimer writes:

- Atari Artist (Atari) graphics program
- Pixel Artist Deluxe 1.3 (PD) graphics program
- The Brundles (KE-Soft) Lemmings clone
- Musorqua (Analog computing) educational program
- many more (which I do not remember right now!)

Subject: 8.10) What kinds of RAMdisks can be set up on the Atari?

This section by Andreas Magenheimer.

8.10 Atari Ramdisks - An (incomplete) Overview:
[This is version 2.10 from October 2003]

Right from the start of the Atari 8-bit computer era in the late 70`s, Atari users wanted to have as much RAM as possible (or as their purse could afford). Having a 16k machine with a tape device was nice and cheap, but having full 48k or 64k and a floppy drive was much nicer (and very expensive). Thus many Atari users began to create selfmade RAM extensions and enhancements, just to save some money. Also a lot of firms provided extra RAM, RAM enhancements, RAM extensions and Ramdisks. Besides Atari there were (and still are) quite a lot of producers, manufacturers, distributors and authors of such RAM enhancements...

This "short" and incomplete overview does not provide any docs or manuals, but gives some info about the various Ramdisks on the market. Since these notes are written by me, they will merely contain the information I have. And as you all can see - it is still incomplete. So any help and extra info, as well as corrections, are very welcome. It would be nice to see this text & info growing. For now let us start here, the info-section is divided into 8 groups:

1) Name (Name of the RD, e.g. Megaram 2 or Rambo XL or MIO, etc.);
2) Vendor/Author (or distributor, manufacturer, producer, etc.);
3) Size (size of the Ramdisk only; NOT the full computer memory);
4) [Bankswitching] Area (for XL/XE computers usually 4000-7FFF);
5) Banks (hexadecimal input count, as in MyDOS or RAMDTEST.BIN);
6) Control Bits (which bits are used to control the Rambanks);
7) Port (control Port - usually Port B for XL/XE machines);
8) Notes (any extra info, comments, miscelleanous things, etc.);

If you wish to add any other type of info, let me know. The above information should be enough for most programmers to support a RD in their programs (especially to support more than just one type of RD). Hopefully future programs will take care about this info or just use a small setup program to setup any kind of RD. Now let me begin:

A) Atari 400/800 Ramdisks:

Name Vendor Size Area
Banks Bits Port Notes

- Axlon Axlon/Atari 64k 4000-7FFF
0 thru 3 0,1 (CFFF) plug-in-board
Note: total memory = 96kbytes (32k RAM + 64k RD);

- Axlon Axlon/Atari 128k 4000-7FFF
0 thru 7 0,1,2 (CFFF) plug-in-board

Note: total memory = 160kbytes (32k RAM + 128k RD);

- 288k800 D.Byrd and others 256k 4000-7FFF
0 thru 15 0,1,2,3 (CFFF) selfmade-board
Note: total memory = 288kbytes, Axlon compatible;

- 544k800 various authors 512k 4000-7FFF
0 thru 31 0,1,2,3,4 (CFFF) selfmade-board
Note: total memory = 544kbytes, Axlon compatible;

- 1056k800 various authors 1024k 4000-7FFF
0 thru 63 0,1,2,3,4,5 (CFFF) selfmade-board
Note: total memory = 1056kbytes, Axlon compatible;

- 2080k800 various authors 2048k 4000-7FFF
0 thru 127 0,1,2,3,4,5,6 (CFFF) selfmade-board
Note: total memory = 2080kbytes, Axlon compatible;

- 4128k800 various authors 4096k 4000-7FFF
0 thru 255 0,1,2,3,4,5,6,7 (CFFF) selfmade-board
Note: total memory = 4128kbytes, Axlon compatible;

=> Note that all so-called Axlon "compatible" (256k-4096k) Ramdisks
normally do not homebank when RESET is pressed (a fix should be
available somewhere), whereas original Axlon Ramdisks do homebank
properly !! (Special thanks to Lee Barnes for this note !!)

- Mosaic RAMpower by Mosaic Electronics is actually a Ramboard, that
enhances the memory of your Atari 800; avaiable in 3 sizes: 16k,
32k and 64k (where max. 52k can be utilized from 64k). Looks like
these are no Ramdisks, just (normal/main) RAM enhancements. But maybe
the 64k Ramboard can be patched in some way to gain a small 16k or
32k Ramdisk (48k RAM + 16k RD or 32k RAM + 32k RD) ?!?

- ...

B) Atari XL/XE Ramdisks:

Name Vendor Size
Area Bits Port
Banks
Notes

=> Note that bit 4 is always used in all Port B type memory upgrades to
turn on the CPU's access to the extended memory. Thus, it is not reported
in bit use tables as a used bit as it does not control which bank gets
switched into the 4000-7FFF region. This seems to be a standard convention
as the majority of ramdisk users don't want bit 4 counted as a control bit.
And it's not a control bit - its the 'on' bit. Likewise, bit 5 is the 'on'
bit for ANTIC's access to the extended memory for 'compatible' (to 130XE)
machines as well. If bit 5 does show up in a bit use table, one can only
assume that this is an incompatible machine which doesn't have or use ANTIC

access at all. In that special case, bit 5 is then available for use in
switching in the various banks and thus gets counted as a control bit in
bit use tables. (Special thanks to Lee Barnes for this note !!)

- 130XE-Ramdisk Atari 64k
4000-7FFF 2,3 B ($D301)
Banks: E3,E7,EB,EF;
Notes: old=8kbyte chips (west), new=32kbyte chips (east);
XE`s made in China have faulty GTIAs => replace them!;
XE`s and XEGS made in China also have a new OS which causes
some incompatibility problems (try: Encounter / disk version
by Novagen or try: Muad`Dib-Demo by Hurek, etc.); just replace
the new OS with an older XL/XE one if you want less trouble!;
standard Atari RD - available with all XE-compatible ramdisks;
Antic access: YES! Atari Basic: YES! XL/XE Selftest: YES!;

- 192k-600XL Compyshop 128k
4000-7FFF 2,3,? B ($D301)
Banks: e3,e7,eb,ef,a3,a7,ab,af;
Notes: early CS upgrade version for 600XL only!;
afaik this was a piggy-back version...;
Antic access: no! Atari Basic: YES! XL/XE Selftest: YES!;

- 320k-800XL Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2b,2f,63,67,6b,6f,a3,a7,ab,af,e3,e7,eb,ef;
Notes: afaik this was a piggy-back version...;
Antic access: no! Atari Basic: YES! XL/XE Selftest: YES!;

- 320k-130XE Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2b,2f,63,67,6b,6f,a3,a7,ab,af,e3,e7,eb,ef;
Notes: afaik this was a piggy-back version with sep. Antic!;
(XE meant 130XE only! this excluded 65XE and 800XE!);
Antic access: YES! Atari Basic: YES! XL/XE Selftest: YES!;

- 512k XL various authors 448k
4000-7FFF 2,3,4,5,6,7 B ($D301)
Banks: ef,eb,e7,e3,cf,cb,c7,c3,af,ab,a7,a3,8f,8b,87,83
6f,6b,67,63,4f,4b,47,43,2f,2b,27,23;
Notes: This 512k upgrade is not the same as the one thats on the
British Underground. That one dont work, I had to fix it years ago.
The new version will replace the 64k main RAM with 512k RAM, thus
you gain 64k RAM and 448k Ramdisk. (A.M.: Afaik, it has the same
problems as the 256k RAM enhancements [with 64k RAM and 192k Ramdisk],
meaning *some* programs will try to use the main RAM as rambanks...)
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!;

- A.M. Ramdisk Atari Magazin 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: manual and schematics, as well as a parts list can be found

in german Atari Magazin 2/1987 (includes a Basic test program!);
bugfixes and updates in Atari Magazin 3/1987, 4/1988 and 5/1988;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!;

- Bob Woolley`s Atari 1200XL 1MB upgrade 960k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: EF, ED, EB, E9, E7, E5, E3, E1
CF, CD, CB, C9, C7, C5, C3, C1
AF, AD, AB, A9, A7, A5, A3, A1
8F, 8D, 8B, 89, 87, 85, 83, 81
4F, 4D, 4B, 49, 47, 45, 43, 41
2F, 2D, 2B, 29, 27, 25, 23, 21
0F, 0D, 0B, 09, 07, 05, 03, 01
Notes: this upgrade uses 64k as main RAM and 960k as Ramdisk;
Selftest: Yes!, Basic: "no" (not built-in), Antic access: no! ;

- Mathy`s RD M.v.Nisselroy 1024k
4000-7FFF 0,1,2,3,6,7 B ($D301)
Banks: EF EE ED EC EB EA E9 E8 E7 E6 E5 E4 E3 E2 E1 E0
AF AE AD AC AB AA A9 A8 A7 A6 A5 A4 A3 A2 A1 A0
6F 6E 6D 6C 6B 6A 69 68 67 66 65 64 63 62 61 60
2F 2E 2D 2C 2B 2A 29 28 27 26 25 24 23 22 21 20
Notes: uses a PC-SIMM (30-Pin-SIMM), pin-switching in RD: 4,5;
XL/XE/XEGS: Selftest+Basic=YES, XEGS: Missile Command=YES!;
no use of any switches!; Antic access: YES!; (CS-compatible!);

- Megaram 1 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: used 16kbyte Chips x16 (very big/huge pcb);
originally designed (and maybe produced?) by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 2 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 128kbyte Chips x2 (much smaller pcb);
originally designed (and maybe produced?) by Ralf David;
newer MegaRAM version; fully compatible to Megaram 1;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 1,2 => 512k B.Pahl 512k
4000-7FFF 2,3,5,6,7 B ($D301)
Banks: 03,07,0B,0F,23,27,2B,2F,43,47,4B,4F,63,67,6B,6F,
83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: upgrade for Megaram 1 or 2 to 512kbytes (which means
a total of 576kbytes memory); requires a small pcb (in
connection with the existing Megaram 1 or 2 pcb) and the
following chips: 2x 414256 (RAM), 1x 74LS138 plus some more
wires inside the computer; additionally one may install a
switch to switch down to 320k or even 64k (no RD!) if needed;
advantage: more RAM, Basic still there, 26AE & 8ACE banks...;

Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 256kx4 Chips (514256-70); fully compatible to
K.P./R.D. Megaram 1+2; originally designed by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 Klaus Peters 1024k
4000-7FFF 2,3,6,7 B ($D301)
0,1 (or switches) B ($D600)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
$D600: F3,F7,FB,FF...
Notes: uses 1Mx4 Chips (514400-70); can be a) 1 Ramdisk of 1 Mb
or b) 2 Ramdisks of 512kb each or c) 4 Ramdisks of 256kb each;
uses four switches; the 1MB mode seems to be very incompatible!!;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

=> Note that all XL-type Megaram-Ramdisks (Megaram 1, 2, 3)
have Refresh bugs/problems which can be solved quite easily
with one 74LS08 chip (see ABBUC magazine 63, pages 19+20);
None of the Megaram Ramdisks do have the separate Antic access
built-in, but XE-types can be upgraded easily for this mode!!;

- Newell Newell Ind. 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: a) older version: 83,87,8B,8F,C3,C7,CB,CF,E3,E7,EB,EF;
b) newer version: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses
64k as main RAM and 192k as Ramdisk/extra RAM (therefore some
RD-testers will see 240k memory or 15 RD-banks which is untrue!);
the older 256k Newell version was not compatible to Rambo XL,
Buchholz and Peterson, since these were not available then;
Newell was earlier on the market than Rambo and Peterson,
while early Buchholz Ramdisks used 32k banks instead of 16k
banks; all this changed with the appearance of the 130XE
and thus Buchholz designed 16k Rambanks and finally Newell
256k Ramdisks became Buchholz/RamboXL/Peterson compatible !!
Atari Basic: YES! XL/XE Selftest: YES! Antic access: YES!

- Newell Newell Ind. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F

C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: uses 8 pc. 1Mx1 Chips (511000-80); Basic: To be able to
select the internal Basic, connect a toggle switch between ground
and the motherboard where PB1 was removed (PIA `Hole' 11). The
switch is not much different than the Option Key, and I found it
more versatile. (Wes Newell) => see also ABBUC mag. 29, page 6+7;

Atari Basic: yes/no! XL/XE Selftest: YES! Antic access: YES!

=> Note that so-called "Newell-compatible" Ramdisks (clones or selfmade ones...) most likely do NOT have Antic access, due to the lazyness of its creators or their intentions of simply not needing it. However, original Newell Ramdisks created and sold by Wes Newell do have the separate Antic access !!

- Newell Newell Ind. 4096k

Notes: uses 8 pc. 4Mx1 Chips (541000-80); made by Newell, later by FTE; seems to be very incompatible to existing software and bankswitching cartridges (OSS, Atari, etc.), because normal RAM at 4000-7FFF is NOT available - only extra Ram/Ramdisk banks. With one PIA chip there is simply no bit left to switch between main RAM and extra RAM / Ramdisk. But with the installation of a second PIA chip one would be able to do so. Furthermore one may use (almost) any setup or banks he likes then (with a second PIA chip one could control up to 256 Megabytes of RAM). Basic: To be able to select the internal Basic, connect a toggle switch between ground and the motherboard where PB1 was removed (PIA `Hole' 11). The switch is not much different than the Option Key, and I found it more versatile. (Wes Newell); OS: It is possible to maintain OS bankink using 4 Megs. It requires moving the OS into RAM before any banking of that Bit occurs. Use MOVEOS File on the [Newell-Software-] Disk. (Wes Newell)
Atari Basic: no! XL/XE Selftest: no (?) Antic access: no!

- Peterson 256k S.Peterson 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz, Rambo XL and newer Newell versions; replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses 64k as main RAM and 192k as Ramdisk (most RD-testers will therefore see 240k memory);
Antic access: no!, Atari Basic: YES!, XL/XE Selftest: YES!

- Peterson 320k S.Peterson 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to TOMS (?), incompatible to Compyshop!;
there are still the 64k main RAM plus this 256k extra RAM;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Peterson 576k S.Peterson 512k
4000-7FFF 1,2,3,5,6 B ($D301)
Banks: 81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF,
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF;
Notes: should be fully compatible to TOMS-Ramdisk (?);
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

- Peterson 1088k S.Peterson 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F

C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: fully compatible to Newell and TOMS (?) Ramdisks;
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

=> Note that (separate) Antic access can be done to all Peterson
and compatible XE-type Ramdisks; just refer to Ed Bachman`s fine
article (supplied with the manual for the Wedge) on how to
update/upgrade your Peterson or compatible Ramdisk for Antic access;
(Afaik only XE-type computers can be upgraded for separate Antic
access, since XL-type computers don`t have the Freddie and Gate
Array chips; the Freddie chip controls the Gate-Array chip; the
Gate-Array chip is responsible for the separate Antic mode...)

- Quarter-Mega-XL C.Buchholz 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF (=newer version);
Notes: compatible to Peterson, Rambo XL and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses 64k as main RAM
and 192k as Ramdisk (therefore most RD-testers will see 240k memory);
older versions were designed for 32k banks, but with the appearance of
the 130XE as the new standard, the design had been changed to 16k banks;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Rambo XL ICD 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz, Peterson and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and uses 64k as main RAM and
192k as Ramdisk (therefore most RD-testprograms will see 240k memory);
built in Atari Basic: YES!, XL/XE Selftest: YES! Antic access: no!

- Rambo=>512k Dan Schmid 512k
4000-7FFF 2,3,5,6,7 B ($D301)
Banks: 00,04,08,0C,20,24,28,2C,40,44,48,4C,60,64,68,6C, (Basic

80,84,88,8C,A0,A4,A8,AC,C0,C4,C8,CC,E0,E4,E8,EC; on??)
Notes: this "project" should upgrade a Rambo XL to 576kbytes;
the docs were found on Pooldisk Too (SUBDIR: ACE/Acec202 a+b);
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no (?)

- Satantronic`s 1MB PC-SIMM Ramdisk 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F

Notes: should be compatible to Newell & S.Peterson (?)
Atari Basic: no! XL/XE Selftest: YES! Antic access: no (?)

C) Parallel-Bus-Devices:
(600XL/800XL = parallel bus, XE = cart-port + ECI and/or adapter)

- Turbo Freezer XL Bernhard Engl 256k
4000-7FFF 2,3,4,5,6 B ($D301)
Banks: E3,E7,EB,EF,93,97,9B,9F,A3,A7,AB,AF,B3,B7,BB,BF;
Notes: The Turbo Freezer XL is an external device for the XL-PBI
with its own Operating-Sytem. It has a built-in Freezer, Monitor
and DOS. The Antic access for the RD can simply be built with one

wire from CPU to PBI. The RD Access works with Port-Bits 2,3 for
Bank Switching, Bits 4,5 for Groups and Bit 6 for "Mode-Select".
PortB D7 = Selftest (0=on)
D6 = Mode (1 = XE, 0 = Groups)
D5 = XE: ANTIC-Access (0 = on), Groups: Group H
D4 = XE: CPU-Access (0 = on), Groups: Group L
D3 = Bank Number H
D2 = Bank Number L
D1 = BASIC ROM (0 = on)
D0 = OS ROM (0 = off)
Atari Basic: YES! XL/XE Selftest: YES! Antic access: optional;

- missing info for the following Ramdisks:
other Bob Woolley Ramdisks, more 600XL Ramdisks, Rambo XL (512k by
ICD), some Irata Ramdisks, MIO, as well as many other types;
- (?) means: info is missing or I am not absolutely sure about this
information; so this has to be verified by other Atarians;

For this 20th edition special thanks and credits go to: Lee Barnes,
Russ Gilbert, Mathy van Nisselroy, Erhard Puetz, Mathias Reichl,
Ron Hamilton, Wes Newell, Guy Ferrante, XI of Satantronic, Bernhard
Pahl and Walter Lojek for sharing their info with me. Also thanks to
John Picken for writing an excellent article about ramdisks and
cartridges (especially about bank-switching, which both devices can
do). And thanks to Jindrich Kubec (Jindroush) for presenting this fine
article on his homepage... Finally thanks to Michael Current for
publishing/including this "spam" in his A8FAQ and all the nice Atarians
at comp.sys.atari.8bit for their help and patience. -Thank you Folks !!-
Well, thats it for today - there is still a lot of information missing,
I know, but any help is appreciated. If you have some more information
or other things that might help, let me know. Please do also send
corrections since there will always be some updates and corrections
nescessary. Atarian Greetings - Andreas Magenheimer.

Subject: 8.11) What programs support a RAMdisk?

This section by Andreas Magenheimer.

8.11 Ramdisk-supporting Software:
(This is Version 2.10 from October 2003)

Well, I will only list those programs here that have BUILT-IN! ramdisk
support. Why? Simply, because most if not all PD programs can support
a RD, as soon as the user a) has a certain DOS or RD driver or b) has
a special OS inside the computer or c) has any kind of special and
non-standard hardware. Just one example: With the use of QMEG+ OS it
is possible to freeze ZORK (or any other protected / unprotected program)
into the RD, then re-direct the RD as being drive 1 and finally boot
Zork off of the Ramdisk, allthough Zork does not support a RD in any way.

The same funny things can be done to other copy protected programs and
especially to unprotected public domain programs... Now, let me begin:

A) DOS programs:

a) Name(s) b) Author(s)
c) RD-type(s) d) max. size

- Atari DOS 2.0 (Atari Corp.) OSS/Atari;
a) Axlon-RDs (selfmade drivers!) 128k;
b) XE-RDs (selfmade drivers!) 130XE (=64k);
(there are some more selfmade RD-drivers available!)

- Atari DOS 2.5 (Atari Corp.) OSS/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;
b) XE-RDs (selfmade drivers!) max. 2x128 kbytes;
c) Axlon-RDs (selfmade drivers!) 128 kbytes;
(there are very many selfmade RD-drivers available!)

- DOS 3.0 (Atari Corp.) ???/Atari;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen any (nor used DOS 3);

- DOS 4.0 (Atari/Antic) Michael Barall;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen them (nor used DOS 4);

- Bewe-DOS Bewesoft/J.Bernasek;
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Rambox (standard driver!) up to 256 kbytes;
(Bewe-DOS is compatible to Sparta-DOS but does not use the RAM
under the OS ROM! many tools can be used under both DOS versions);

- Bibo DOS Compyshop/E.Reuss;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade drivers!) up to 256 kbytes;

- DOS II+D Version 6.x Stefan Dorndorf;
a) XE-RDs (standard driver!) max. 2x128 kbytes;
b) Rambox (selfmade drivers!) up to 256 kbytes;

- DOS-XE (Atari Corp.) ???/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;
b) other RDs (really?!?) unknown;
=> has the same author as the unpopular (Atari) DOS 3.0 !!;
(in the Atari scene it is as unpopular as DOS 3 and DOS 4!);

- DOS-XF (Atari Germany) Reitershan Comp.
=> similar in function to Turbo-DOS 2.1XF (but with a nice
DOS 2.0 / 2.5 DUP-menu!) => see Turbo-DOS !!

- My-DOS 4.5x Wordmark/R.Puff+C.Marslett
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Axlon-RDs (standard driver!) up to ??? kbytes;
c) other RDs (MIO, BB, etc.) up to 1024 kbytes?;

- Smart-DOS Version 6.1 Ron Bieber;
a) XE-RDs (selfmade drivers!) up to 64 kbytes;
b) Axlon-RDs (selfmade-driver!) up to 128 kbytes;

- Sparta-DOS 1.x (400/800) ICD;
a) Axlon-RDs (??? drivers) up to 128 kbytes;
b) other RDs (??? drivers) up to ??? kbytes;

- Sparta DOS 2.x, 3.x (XL/XE) ICD / FTE;
a) XE-RDs (standard drivers!) up to 1024 kbytes?;
b) others (MIO, BB, etc.) up to 1024 kbytes?;
(maybe also RD-drivers for up to 16 Megabytes ?!?)

- Sparta DOS 3.3x (XL/XE) Stephen J. Carden;
=> see Sparta DOS 2.x and 3.x !!
(especially made for use with BBS-Express-Pro!)

- Sparta DOS X / 4.x (XL/XE cart.) John Harris/FTE;
=> see Sparta DOS 2.x and 3.x !!
(maybe with RD-driver for up to 16 Megabytes ?!?)

- Super DOS 2.x Paul Nichols;
a) XE-RDs (standard driver!) up to 128 kbytes;
b) Axlon-RDs (standard driver!) up to 128 kbytes;

- Super DOS 5.x Paul Nichols;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) Axlon-RDs (standard driver!) up to 128 kbytes;

- Top-DOS 1.x R.K. Bennett
a) Axlon-RDs (standard driver!) up to 128 kbytes;
b) 130XE-RD (standard driver!) 64 kbytes;
c) other RDs (Mosaic?! driver!) up to ??? kbytes;

- Turbo-DOS 1.x, 2.x Reitershan Comp.;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (MIO, Irata, etc.) up to 256 kbytes;

- X-DOS 2.x Stefan Dorndorf;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade drivers!) up to 256 kbytes;

B) Non-DOS programs:

a) Name(s) b) Author(s)
c) supported memory d) RD-type(s)

- A-Base 130XE (TOOL) ??? (author unknown);
64k, 128k 130XE-Ramdisk;

- ABBUC-Magazine-Intro 52 (DEMO) Karolij N./Heaven
64k, 128k 130XE-Ramdisk
(has different intros on 64k / 128k machines!)

- ABBUC-Magazine-Intro 55 (DEMO) Karolij N./Heaven
64k, 128k 130XE-Ramdisk
(with different intros on 64k / 128k machines!)

- Adalmar (GAME) F.Buettner (PPP);
64k, 128k 130XE-Ramdisk;

- Alphasys-Sample-Software (TOOLs) (Mirage+ANG);
a) 64k, 128k 130XE-Ramdisk;
b) 320k 26AE = YES!, 8ACE = ???;
(there are several programs for 64k or 128k memory; there
is also one -and only one- program for 320k Ataris)

- Anime 4ever (DEMO) Sente-Software-Group;
64k, 320k 26AE ???, 8ACE ??? ;
(on 64k Ataris all pics load from disk, on 320k Ataris from Ramdisk)

- A.R.-The Dungeon (GAME) P.Price/Datasoft;
48k, 64k, 128k 130XE-RD;

- A-Text (TOOL) ??? (author unknown);
64k, 128k 130XE-RD;

- Atari-Writer-80 (TOOL) (Atari);
48k, 64k, 128k 130XE-RD;

- Atari-Writer-Plus (TOOL) (Atari);
48k?, 64k?, 128k 130XE-RD;

- Basic-XE (TOOL) OSS/ICD/FTE
64k, 128k 130XE-RD;

- Bop N'Wrestle (GAME) (Mindscape)
64k, 128k 130XE-RD
(on 64k Ataris the floppy will never stand still!)

- [The] Brundles (GAME) A.R.+C.S.S. (KE-Soft);
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;
(merely copies the levels into the RD and loads them from there;
if you don't want to play all 100 levels at once, 64k is enough!)

- Datei 4.x (database TOOL) Norbert Schlia;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Desktop Atari (TOOL) H.B.S.F
64k, 128k RAM 130XE-RD;
(the Key "7" in the Main Menu copies the whole program into the RD)

- Diskcomm. 2.x, 3.x (TOOL) Robert "Bob" Puff;
a) extra RAM (answer with Yes) detects up to 10 banks (hex.)?;
b) Ramdisk (answer with No) all DOS 2, My-DOS and Sparta RDs;
(Ramdisk size depends on the DOS and RD driver you are using, i.e.

with TurboDOS up to 256k, with MyDOS or Sparta maybe up to 1 Megabyte)

- Diskworker 130XE (Tools) PETSOFT
64k, 128k RAM 130XE-RD;

- Extended-Atari-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Extended-Turbo-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Fampy 2.3 (Bootdisk; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Fampy 6.1i+ (ML-File; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Grafik+Sound Demo (DEMO) Dendrit-Soft/P.Sabath;
(48k?) 64k, 128k 130XE-Ramdisk;

- Howfen-DOS 3.x, 4.x (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Howfen-Tape-to-Disk (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Human Torch & The Thing Questprobe (SAGA+Marvel);
48k/64k, 128k RAM 130XE-Ramdisk
(The main program or some pics will be copied to the Ramdisk)

- Inertia 2.9 (TOOL) Mad Team;
a) 64k RAM (16k only) 16k usable memory (1 bank);
b) 128k RAM (16k+64k) 130XE-Ramdisk; (5 banks);
c) 320k RAM (16k+256k) 26AE & 8ACE RDs (17 banks);

- I.K. Plus Demo (GameDEMO) ??? (authors unknown)
a) 64k RAM only graphics;
b) 128k RAM graphics + sound;

- Megablast 1 (GAME) Thorsten Karwoth;
64k, 128k 130XE-Ramdisk;

- Midi-Mate II (Tool) Hybrid Arts;
64k, 128k 130XE-Ramdisk;

- Midi-Pattern-Editor (TOOL) Raster/Radek Sterba;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE-RDs?;

- Midi-Player (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Recorder (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Sequencer (TOOL) Maciej Sygit;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- MSC-IDE interface software (TOOLs) M.Belitz+S.Birrmanns;
64k, 128k 130XE-Ramdisk
(some programs/drivers use the Ramdisk, if no Ramdisk is
available, they will use & erase the RAM area 4000-7FFF)

- [The] Muppet-Movie (DEMO) Mad Team;
64k, 128k 130XE-Ramdisk;
(on 128k Ataris some pics are loaded from the Ramdisk)

- [The] Page Designer (TOOL) XLent
64k, 128k 130XE-Ramdisk;

- Paperclip II (TOOL) Batteries Included;
48k?, 64k, 128k 130XE-Ramdisk;

- Questprobe featuring Spiderman - see: Spiderman;
(afaik, THE HULK does not support 128k RAM);
- Questprobe featuring Human Torch and Thing - see Human Torch;

- Spiderman Questprobe (SAGA+Marvel);
48k/64k, 128k RAM 130XE-Ramdisk;
(The main program or some pics will be copied to the Ramdisk)

- Sweet Fantasy (DEMO) Tight;
64k, 128k 130XE-Ramdisk;
(on 128k machines the gr.9 pics are loaded from the ramdisk,
on 64k Ataris the gr.9 pics are loading from the disk drive);

- Syncalc "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

- Synfile "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

- Synhome "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

(other programs by Synapse should also support Axlon-Ramdisks)

- Textpro 5.x (TOOL) Ronnie Riche;
48k, 64k, 128k and more 130XE-RD, 26AE & 8ACE RDs;
(here the RD-bank Macros *.ADN and/or *.BNK will require extra RAM
/ Ramdisk; simply don`t use them if you merely have 48k or 64k !!)

- The Browser (TOOL) CTH / Tom Hunt;
64k, 128k and more all Sparta-DOS Ramdisks;

- The Top-3 Demo (DEMO) W.F.M.H.;
64k, 128k 130XE-Ramdisk;
(the dancing girl -"Veronika"- supports 64k and 128k memory!)

- Typesetter XL/XE (TOOL) XLent;
64k, 128k 130XE-Ramdisk;

- [The] X-Files Shpoon;
64k, 128k, 320k 130XE-RD, 26AE or 8ACE RDs?;

- thats all I remember right now...

Note: - Axlon means any Axlon compatible Ramdisk;
- 130XE means 128k memory (64k RAM + 64k RD);
- AE means 192k memory (64k RAM + 128k RD);
- 26AE means 320k memory (64k RAM + 256k RD)
=> Compyshop types (and compatibles, like Mathy`s RD);
- ACE means 256k memory (64k RAM + 192k RD)
=> Newell, Buchholz, Peterson, Rambo XL (and compatibles);
- 8ACE means 320k memory (64k RAM + 256k RD)
=> Newell?, TOMS, Peterson, Rambo XL? (and compatibles);
- ? means I am (generally) unsure -or:- I am not sure if
the given information is correct (just check it out!);

Thats all for now. Thanks and credits go to Russ Gilbert, Lee Barnes
Bernhard Pahl and Mathy van Nisselroy for sharing some info with me.
Any further help or info is welcome !! -Andreas Magenheimer.

Subject: 8.12) What programs require a RAMdisk?

This section by Andreas Magenheimer.

8.12 Atari-programs that require Extra-RAM / Ramdisk:
[This is version 2.10 from October 2003]

A) Non-Demo-Programs:

a) name(s): b) author(s):
c) memory (min.): d) RD-Type(s):
e) notes

- 130XE-(Bank-)Tester (TOOL) various authors (PD);
128k memory (64k RAM + 64k RD) 130XE-Ramdisk (E3,E7,EB,EF);
(1 block with 4 banks, overall: 4 banks);

- 192k-Memory-Tester (TOOL) various authors (PD);
192k memory (64k RAM + 128k RD) A,E Ramdisk blocks;
(2 blocks each with 4 banks, overall: 8 banks);

- 256k-Memory-Tester (TOOL) various authors (PD);
256k memory (64k RAM + 192k RD) A,C,E or 8,A,E blocks;
(3 blocks each with 4 banks, overall: 12 banks);

- 320k-Memory-Tester (TOOL) various authors (PD);
320k memory (64k RAM + 256k RD) 8,A,C,E or 2,6,A,E blocks;
(4 blocks each with 4 banks, overall: 16 banks);

- 576k-Memory-Tester (TOOL) various authors (PD);
576k memory (64k RAM + 512k RD) (overall: 32 banks);
(8 blocks x 4 banks -or- 4 blocks x 8 banks);

- 1088k-Memory-Tester (TOOL) various authors (PD);
1088k memory (64k RAM + 1024k RD) (overall: 64 banks);
(4 blocks x 16 banks for Mathy van Nisselroy`s RD and maybe others);

(8 blocks x 8 banks for Newell, Peterson, TOMS and compatibles);
(16 blocks x 4 banks should also be possible, but do not exist yet!);

- 2112k-Memory Tester (TOOL) Satantronic`s XRAM 0.18;
2112k memory (64k RAM + 2048k RD) (overall: 128 banks);
(8 blocks x 16 banks -or- 16 blocks x 8 banks);

- 4160k-Memory-Tester (TOOL) ??? (authors unknown);
4160k memory (64k RAM + 4096k RD) (overall: 256 banks);
(16 blocks x 16 banks, means blocks 0-F each with banks 0-F);
(note: with 1 PIA chip the main RAM 4000-7FFF is not available!);

- 8256k-Memory-Tester (TOOL) ??? (authors unknown);
8256k memory (64k RAM + 8192k RD) (overall: 512 banks);
(afaik, this upgrade requires 2 PIA chips or some uncool tricks!);

- 16448k-Memory-Tester (TOOL) ??? (authors unknown);
16448k memory (64k RAM + 16384k RD) (overall: 1024 banks);
(afaik, this upgrade requires 2 PIA chips or some uncool tricks!);

=> Note that 2MB-16MB extra RAM / Ramdisks are very uncommon
in the Atari scene! These upgrades were once sold by ICD and
Newell (maybe a few ones also by FTE) and of course they were
and still are selfmade by some crazy Atarians. It is not clear
if there is any software (games, apps., demos) available, that
supports these mega-upgrades fully. Afaik, only few Atarians
have and use them, mostly users of mailboxes / BBS`es...;

- APC-Archiver 1.0 (TOOL) LBS/APC;
320kbytes minimum memory 26AE = no!, 8ACE = YES!;
(It seems like this program does not work on Ataris which have
more than 320kbytes of RAM, i.e. it crashes on my 576k Atari)

- APC-Packer 1.1 (TOOL) LBS/APC;
320kbytes minimum memory 26AE = no!, 8ACE = YES!;
(It seems like this program does not work on Ataris which have
more than 320kbytes of RAM, i.e. it crashes on my 576k Atari)

- Atari Writer Plus Super Menu Ken Siders;
a) AWP + Super Menu 128k RAM 130XE-Ramdisk;
b) AWP-XE + Super Menu 256k RAM 26AE = ???, 8ACE = ???;

- ATOS/ATari Operating System (TOOL) CTH / Tom Hunt;
64k RAM + 16MB-HDD-Partition all Sparta-DOS Ramdisks;
(the standard system is configured for a 16MB harddisk partition,
however it is possible to change this and use an Atari with a big
floppy drive and/or ramdisk; but this requires quite some work!)

- Audio/Studio Master ANG/Mirage;
minimum 320k RAM 26AE = YES!, 8ACE = ???;
(the program is a part of the 4Bit A/D converter software!)

- Boot-Majster (TOOL) Electron;
128k RAM 130XE-Ramdisk;

- Boss-X - Version 10.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- Boss-XE - Version 8.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- CAD-XE (TOOL) (HAPS-PD 0350);
128k RAM 130XE-Ramdisk;

- Castle of Blackthorne (GAME) L.o.D. / Thimo Graef;
128k RAM 130XE-Ramdisk;

- Cavepack (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Computer Baseball (GAME) Douglas Blackwell
128k RAM 130XE-Ramdisk

- Degas-View-XE (Tool) Mat*Rat / Mathew Ratcliff;
128k RAM 130XE-Ramdisk;

- Diskettenverwaltung 130XE (TOOL) (ABBUC PD 86);
(database 130XE) 128k RAM 130XE-Ramdisk;

- Draw XE (TOOL) (ABBUC PD 387);
128k RAM 130XE-Ramdisk;

- Dream Vision (TOOL) (ABBUC PD 480);
(IFF-Viewer) 256k RAM 26AE = YES!! ; 8ACE = ??? ;

- Filemanager/Filecopiers (TOOLS) various authors (PD);
128k=> 1 floppy is enough Sparta and DOS 2.x RD`s;

- Fraktale & Colorprint (TOOLS) (ABBUC PD 349); P.Woetzel;
(fractals & colorprint) 128k RAM 130XE-Ramdisk;

- Gizmo`s Castle (GAME) Black Panther / M. Kugler
XE-Version = 128k RAM 130XE-Ramdisk;

- Grafik-Zeilen-Editor (TOOL) (HAPS PD 0296);
(graphic-line-editor) 128k RAM 130XE-Ramdisk;

- Hi-Res Designer (TOOL) (HAPS PD 0015);
(gr.8 drawing program) 128k RAM 130XE-Ramdisk;

- Hires-Dump (TOOL) (ABBUC PD 113);
(gr.8 print-program) 128k RAM 130XE-Ramdisk;

- Inertia 4.5 (MODplayer TOOL) MadTeam
a) 128k RAM 130XE-Ramdisk
b) more than 128k RAM 26AE = YES!, 8ACE = YES!;

- Kaiser II (GAME) Phoenix Softcrew / C.Strotmann;
a) 64k RAM Version any 64k XL/XE computer;
b) 128k RAM Version 130XE-Ramdisk;
c) 320k RAM Version 26AE = YES!, 8ACE = YES!;
(this game comes in 3 separate versions; plays good on 64k

computers, but needs less disk-swaps on bigger machines !!)

- Kassettencopy (TOOL) (ABBUC PD 466); J.Gernreich;
(Cass.copy) Copy64 = 128k RAM 130XE-Ramdisk;

- Kemna-Video (TOOL) (ABBUC PD 185);
(intro-creator) 128k RAM 130XE-Ramdisk;

- Koala Slideshow XE (TOOL) Charles Johnson/Analog
128k RAM 130XE-Ramdisk

- Koenigsdiamanten (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Lightraces (Game) (Power per Post);
XE-Version = 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE 4.32 (TOOL) (ABBUC PD 297); T.Karwoth;
(older version!) 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE+ 2.x (TOOL) (ABBUC PD 368); T.Karwoth;
(newer version!) a) 128k RAM 130XE-Ramdisk (MyDOS only!);
b) 128k - 1088k (MyDOS only!) 26AE = YES!! ; 8ACE = YES!! ;
(has a rambank-finder program that can be loaded from Basic or the
menu!; the assembler does not work on a CS ramdisk with refresh bugs!)

- Masher-XE V1.0 ??? (author unknown);
minimum 128k RAM 130XE-Ramdisk;
192k, 256k and max. 320k RAM AE, ACE and max. 8ACE RDs;

- Memdrv10 (RAM-Tester TOOL) Andre 'MacFalkner' Bertram
$D301 all Portbits 16k up to 4 MB (all standard RD`s);
$D600 up to ??? MB (Klaus Peters Megaram 3 Ramdisk)
includes 16k Bankswitching and exotic 32k (Buchholz) Bankswitching

- Menu 130 (TOOL) Les Howarth/Page 6
128k RAM 130XE-Ramdisk

- Midi Mate III Hybrid Arts;
128k RAM 130XE-Ramdisk;

- Minesweeper 1-4 (GAMEs) J.R.Chiko/S.A.S.;
128k RAM (4 game versions) 130XE-Ramdisk

- Mister X (Game) (Power per Post);
128k RAM 130XE-Ramdisk;

- Monitors, Debuggers & more (TOOLS) (HAPS PD 0109);
some programs require 128k RAM 130XE-Ramdisk;

- Multi-DOS 130 (TOOL) Kuchera/Excellent;
128k RAM 130XE-Ramdisk;

- Multi-DOS 320 (TOOL) Kuchera/Excellent;
320k RAM 26AE = ???, 8ACE = ???;

(note that Multi-DOS 130 and 320 are no DOS-Versions, they can
be used as *.CMC players; all the rest is unknown to me...)

- Multi-Tasking-OS (various ABBUC magazines);
128k RAM minimum 130XE-Ramdisk (+ST-mouse);

- MTOS XE (Tool) CTH / Tom Hunt;
128k RAM 130XE-Ramdisk;

- MTOS 256 (Tool) CTH / Tom Hunt;
256k RAM (64k+192k) 26AE = NO!! , 8ACE = YES!!;

- [Der] Neffe (Game) (ABBUC PD 52);
(the Nephew) XE-Version = 128k RAM 130XE-Ramdisk;

- Neo-Tracker (TOOL) EPI/Allegresse;
192k RAM minimum 26AE = ??? , 8ACE = ???;

- [The] Newspaper-Editor (TOOL) (HAPS PD 0294 english!);
XE-Version = 128k RAM 130XE-Ramdisk;

- Oelbaron (Game) ??? (author unknown);
XE-Version = 128k RAM 130XE-Ramdisk;

- Programmverwaltung 130XE (TOOL) (HAPS PD 0434);
(database 130XE) 128k RAM 130XE-Ramdisk;

- Protracker 1.5 (TOOL) MadTeam;
128k RAM minimum 130XE-Ramdisk;

- (various) Ramdisk drivers (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- Rechnen fuer Kinder (TOOLs) (ABBUC PD 85);
(calculations for children) 128k RAM 130XE-Ramdisk;

- Rund um die Ramdisk (TOOLs) (ABBUC PD 383, HAPS PD 1084);
(RD-testers, etc.) 256k RAM and more various XE-RD`s & Axlon-RD`s;

- Sample-Art-XE Mozart/WSL
a) minimum 128k RAM 130XE-Ramdisk;
b) more than 128k RAM 26AE = ???, 8ACE = ???;
(on my 576k-XL the program has some gr.-bugs and crashes very often!)

- Shrink-XE Peter Fitzsimmons;
min. 128k RAM 130XE-comp.-Ramdisks;

- [The] Small Printery (TOOL) Walter Lojek;
128k RAM or more (up to 1MB) 130XE-Ramdisk (minimum!);

- Snapshot (Tool) ??? (author unknown);
128k RAM 130XE-Ramdisk;

- [The] Sound-Utility (TOOL) CTH / Tom Hunt;
(64k), 128k, 256k, 576k, 1MB 130XE-RD; 8,A,C,E Ramdisks;

- Space Harrier (Game) Sheddy / Chris Hutt;
128k RAM 130XE-Ramdisk;

- Strategy Baseball (Game) (HAPS PD 0302);
128k RAM 130XE-Ramdisk;

- Studio/Audio Master ANG/Mirage
minimum 320k RAM 26AE = YES!, 8ACE = ???;
(the program is a part of the 4Bit A/D converter software!)

- Super-Print-Lab-XE (TOOL) (HAPS PD 0909);
(demo-version) 128k RAM 130XE-Ramdisk;

- System+Memory Tester (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- T-34 (Game) (ANG / Mirage);
128k RAM 130XE-Ramdisk;

- (various.) Tape-Copiers (TOOLs) various authors (PD);
128k RAM 130XE-Ramdisk;

- Tape-Ramdisk-Drivers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- Text-130 (TOOL) B.Russmann;
128k RAM 130XE-Ramdisk;

- Textpro "+" (TOOL) Ronnie Riche;
(e.g. Vers. 4.54+) 128k RAM 130XE-Ramdisk;

- The Code Cruncher (TOOL) Soused Teat / A.Bienias;
128k RAM and more XE-Ramdisks;

- The Cruncher 5.0 (Tool) MSL / Magnus;
128k RAM and more XE-Ramdisks;

- The [Sparta DOS] Wedge (TOOL) Ed Bachman;
128k RAM and more + sep. Antic! XE-RD`s with separate Antic!;

- The Works (Tool) CTH / Tom Hunt;
128k RAM and more 130XE and A,C,E Ramdisks;

- [Die] Wuerttemberger-Disk (TOOLS) (ABBUC PD 361, HAPS PD 1050);
also contains the XE-version of Gizmo`s castle => see Gizmo`s Castle!;

- (various) XE-Sectorcopiers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- XE-Utilities (10 XE-TOOLs) (HAPS PD 0031);
128k RAM 130XE-Ramdisk;

- XL-2 (Tool) John K. Picken;
128k RAM and more all Sparta und DOS 2.x RD`s;

- Zargon (german text-adv. GAME) (ABBUC PD 611, HAPS PD 0485);
128k RAM 130XE-Ramdisk;

- [Der] Zeitungsredakteur (ABBUC PD 121, german!);
(newspaper-editor) 128k RAM 130XE-Ramdisk;

B) Demo-Programs:

- 130XE-Artshow (Koala!) (HAPS PD 0013);
128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k Ataris!)

- 130XE-Autoshow (Oldtimers!) (ABBUC PD 191, HAPS PD 0637);
(130XE carshow) 128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k Ataris!)

- 130XE-Demo S.A.G. (Netherlands);
128k RAM 130XE-Ramdisk;
(written in TB; change all D8: entries into D1: for use with 48k and
64k Ataris; exchange Turbo-Basic XL with TB 3.2q, TB 400 or Frost
Basic for use with older 48k Ataris or (most versions of) Sparta-DOS)

- 130XE-Impossible-Demo Rudy Haegemann / V.T.B.;
128k RAM 130XE-Ramdisk;

- Amiga-Boink-XE Bob Armour;
128k RAM 130XE-Ramdisk;

- American Natives Fox-1 / R.Verdaasdonk;
256k RAM all DOS 2 und MyDOS RD`s;

- (X-Files) Animation-Demo Mad Team;
128k RAM ($04 banks / $4b frames) 130XE-Ramdisk;
(the real name of this demo is unknown to me; maybe it is also called
X-Files-Demo, like the X-Files (picture) demo by Sphoon, maybe it has
a different name; on all tested XL/XE Ataris this demo has graphic bugs)

- Animkomials meet Boris Valleyo Animkomials+Boris Valleyo;
128k RAM (gr.9+11 pictures!) 130XE-Ramdisk; (has a setup!);

- Base-33 AIDS / AIDZ;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> hold down SHIFT upon bootup to get to the Setup-menu!)

- Bill-Pie-Demo ??? (maybe Mad Team?);
a) 128k RAM ($1E frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($36 frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($4C frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop or compatible RD can merely see the 192k version!)

- BMW-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- CES-XE-Demo XANTH (full version);
128k RAM (580 sectors) 130XE-Ramdisk;

- Cogito-Demo AIDS / AIDZ;
192k RAM 26AE = no?! ; 8ACE = YES!! ;

- Comet-Ani MadTeam;
a) 128k RAM ($36 frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($6D frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($96 frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop RD and compatible can merely see the 192k version!)

- Critical-Sound-Demo Innovative;
128k RAM 130XE-Ramdisk;

- Danielle-(Gr.9-TB-)Ani NBS / Bill Kendrick;
a) 64k RAM (499 sectors) Disk = very slowww!;
b) 128k RAM or Harddisk RD/HD = much faster !!;
(=> use your favourite DOS, Turbo-Basic and a RD/HD driver!)

- Edelweiss-Demo A.R. + C.S.S. + S.V.L.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s you can see all demo-parts, however the mainpart,
known as the Edelweiss-Digi-Sample is shorter & sounds strange!)

- Ergo-Bibamus Quasimodos;
128k RAM (with Setup!) 130XE-Ramdisk;
(well, for 130XE and compatible Ramdisks no setup needed!)

- Extract-Slideshow Bit Busters / Replay;
128k RAM 130XE-Ramdisk;

- Glasshead / HTPPD A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Halle 1994b: The Wormhole Magic Arts;
320k RAM 26AE = YES!! ; 8ACE = NO!! ;
(well, this demo does not work at all on 8ACE-Ramdisks!)

- (Atari) Hardware-Demo A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Igor Demo MadTeam;
a) 128k (Part 1, Part 2) 130XE-Ramdisk;
b) 192k (Part 3) 26AE = YES!! ; 8ACE = YES!! ;
c) 320k (Parts 1+2+3) 26AE = NO!! ; 8ACE = YES!! ;
(=> the demo normally runs a setup for 320k memory; but there are 2-3
batch files for each Setup; goto DOS and install the one you want or
need with the JOB command: JOB @xxxx.BAT [RETURN], then reboot disk)

- Imperial (Sounddemo) Innovative;
320k RAM 26AE = YES!! ; 8ACE = YES!! ;

- Impossible but Real! MacGyver / AIDS;
256k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;

(=> press A for 8ACE-RDs, press B for manual setup of other RDs)

- Isolation Demo Masters of Electric City;
128k RAM 130XE-Ramdisk;

- Journey Polynomials
a) 128k RAM ($36 frames) 130XE-Ramdisk;
b) 320k RAM ($96 frames) 26AE = YES!! ; 8ACE = yes!? ;
(=> this demo chooses the Ramdisk & Setup automatically! the demo
has quite some graphic bugs on 8ACE ramdisks, but is viewable!)

- Journey into Sound DGS / Dean Garaghty;
128k RAM 130XE-Ramdisk;

- Khai-Et AIDS / AIDZ;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> hold down SHIFT key upon bootup for the Setup-menu)

- Killer-Whales MadTeam
a) 128k RAM ($2E frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($54 frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($94 frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop RD and compatible can merely see the 192k version!)

- Lajf-Demo MadTeam;
128k RAM 130XE-Ramdisk;

- Landscape-XE-Demo Karl Pelzer;
128k RAM 130XE-Ramdisk;

- Megablast-Sounddemo DGS / Dean Garaghty;
128k RAM 130XE-Ramdisk;

- MTV`s-Danielle see: Danielle-Ani.;

- Nascar-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- Nonjm-Demo TIGHT;
128k RAM 130XE-Ramdisk;

- Numen-Demo Taquart;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> the newer/updated version has an auto-setup for 26AE & 8ACE RD`s!)

- Owca-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Owca-2-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Parrot-X-MAS-Demo Anthony Ramos;
128k RAM 130XE-Ramdisk;

- Pedrokko-Sounddemos Pedrokko (10 Disks / 20 S.);
128k RAM (some demos) 130XE-Ramdisk;

- P.I.T. - Demo Quasimodos;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> a menu appears automatically; setup 15 banks to run the demo!
this demo does not work correct on Ramdisks with refresh-bugs!)

- Raving Vierpz Pentagram;
128k RAM 130XE-Ramdisk;

- Raytracing 320k Elsni/Stephan Elsner;
320k RAM (TB listings!) 26AE = NO!! ; 8ACE = YES!! ;

- Raytracing 1MB Solocoder of A.C.E.;
1088k RAM (K.Peters Megaram 3) works only on K.P.-1MB-RD !!;
(=> Bootdisk with 8 disksides; loading time: approx. 17 minutes!)

- Raytracing Animation Karl Pelzer;
128k RAM 130XE-Ramdisk;

- Revenge of Hacker Rasero Team;
192k RAM (RD-blocks A+E) 26AE = YES!! ; 8ACE = YES!! ;

- Sweet Fantasy TIGHT;
128k RAM 130XE-Ramdisk;

- Sheol Bit Busters;
320k RAM 26AE = NO!! ; 8ACE = YES!! ;
(on 26AE / CS - Ramdisks you will merely receive an error
message like this: sorry, this demo needs 256k of xms RAM)

- Shiny-Bubbles-XE Brian Paul / LACE;
XE-Version = 128k RAM 130XE-Ramdisk;

- Stash-Demo Rasero-Team;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> in the first menu press A for 8ACE Ramdisks or press B for
manual setup of other Ramdisks like Compyshop; in the second menu
press A for 8ACE Ramdisks or C for manual input of Rambanks; don`t
press B -Compyshop- here, since this CS setup is faulty/wrong)

- Starwars-Demo A.R. + C.S.S.;
320k RAM (hold down Option-Key!) 26AE = YES!! ; 8ACE = yes!? ;
(the program checks if Basic is disabled via the Option key, thus
an OS with inverted Basic / Option-key function does not work here!;
with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- The Asskicker Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- The Turtles-Demo (Animation!) Ultra-Software;
128k RAM 130XE-Ramdisk;
(the file version by John E. requires 128k, maybe this bootdisk also)

- The Wormhole Magic Arts;
320k RAM 26AE = YES!!, 8ACE = NO!!;
(this demo is part of the Halle Project 1994 demo, side B!)

- Timekeep(er) New Generation;
320k RAM ??? 26AE = NO!! ; 8ACE = YES!! ;
(after loading on an 8ACE-RD be patient! the demo requires some time
for depacking - don`t switch off when you see a black screen, wait!)

- Tit-Demo MadTeam;
256k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> the Setup appears automatically; accept or change it !)

- Too-Hard-2 Animkomials (Rippers!);
128k RAM 130XE-Ramdisk;

- Too-Hard-3 Animkomials (Rippers!);
192k RAM 26AE = YES!! ; 8ACE = YES ;
(=> the Setup appears automatically; accept or change it!)

- Too-Hard-4 Animkomials (Rippers!);
320k RAM 26AE = YES!!, 8ACE = YES!!;
(=> the Setup appears automatically; accept or change it!)

- Total Daze TIGHT;
128k RAM 130XE-Ramdisk;

- Trabant Demo / HTPPD A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Trip-6-Demo Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- Ultra Taquart;
128k RAM 130XE-Ramdisk;

- Vengeance Excellent;
128k RAM 130XE-Ramdisk;

- Vent Excellent+Pentagram;
128k RAM 130XE-Ramdisk;

- Video Blitz Helvetica Bold;
128k RAM (+sep. Antic!) 130XE-Ramdisk + sep. Antic!;

- WAF-Demo (Side B) ABBUC regional group W.A.F.;
128k RAM (2 Parts!) 130XE-Ramdisk;
(=> here the Raytracing and Vector part require 128k memory!)

- Worms-Demo Datri;
320k RAM 26AE = yes!? ; 8ACE = YES!! ;
(with 8ACE-RD`s you see the complete+bug-free version; with 26AE
RD`s you see a shorter and very buggy version with many deja-vues!)

- X-Demo Mad Team;
320k RAM 26AE = YES!! ; 8ACE = NO!! ;

- Xyberscape-XE Bill Le Masurier;
128k RAM 130XE-Ramdisk;

- Zero-Demo New Generation;
128k RAM 130XE-Ramdisk;

Notes: - 256k Compyshop-Ramdisks, 256k K.Peters-Megaram 1,2,3
and Mathy`s 1024k RD have/use 26AE Ramdisk blocks;
- afaik all other 192k / 256k Ramdisks have ACE (8CE)
or 8ACE blocks (Newell, Peterson, Buchholz, TOMS, etc.);
- ??? means unknown; TB means Turbo-Basic (XL);
- HTPPD means Hobby-Tronic-Power-Pack-Demo;
- YES!! means the demo works as it should (100% correct);
- yes!? means the demo works but has some bugs or is shorter
(50-80% correct);
- no?! means the demo almost does not work and has many bugs
(10-40% correct);
- NO!! means the demo does not work at all - it refuses to load
or crashes shortly after loading (0% correct);
- sep. Antic means separate Antic access of the Ramdisk;
(only 2 programs seem to exist: Video Blitz & The Wedge);

Thanks and credits go to Russ Gilbert, Bernhard Pahl and Mathy van
Nisselroy for sharing their info with me. Any corrections and/or updates
are welcome... - Andreas Magenheimer

Subject: 8.13) What voice/sound synthesis software is there for the Atari?

This section by Andreas Magenheimer.

- S.A.M. - the Software Automated Mouth by Don't Ask Software (a
software package; you can find it at Don`s / the author's homepage:
http://www.retrobits.net)
- Softsynth (a PD program, that creates sounds and sound effects via
modulation of the tv/monitor speaker; available from the ABBUC library);
- MOD-Sounds (sound-MODulation, allthough I do not know any software to
create such sounds on an A8, some programs to edit (Protracker) and
playback (Inertia, Modplayer, Neotracker, etc.) these sounds do exist);

Subject: 8.14) What programs support stereo and upgraded sound?

This section by Andreas Magenheimer.

There is already a lot of stereo software for the upgraded Atari computers
available, of course most of these programs are limited to certain/special
upgrades and merely perform their stereo effects on these items (with

otherwise upgraded or non-upgraded Ataris, the sounds or programs will only play in mono):

a) software for the various stereo-upgrades:

- stereo with one Pokey (POPS-software): Afaik for this kind of upgrade, there merely exists a patched version of the Pokey player program, I am not sure if there is anything else for it; anyway, refer to Analog Computing, issue 66, november 1988, pages 54 -60;

- stereo with two computers (thus two Pokeys): Afaik for this simple trick there merely exist two programs, they are "Perestroyka" and "Sky Network" by T.Liebich. In order to achieve the stereo effect, you have to boot/load one of these demos on two computers (connected to different TV's or monitors, there is no need to connect the computers to each other!). When done, press 1-5 on the first computer while pressing Shift-1-5 on the second computer. Meaning, if you want to hear the first sound in stereo then press 1 on computer 1 and press Shift-1 on computer 2 simultanously (that`s a little tricky, I know). If you want to hear sound 5 in stereo, then press 5 on computer 1 and Shift-5 on computer 2 simultanously. Tricky at first, but sooner or later you will get the hang of it. Of course you can also connect the two Ataris to a hifi-system, using the sound output of one Atari for the left channel and the sound output of the other Atari for the right channel...

- stereo-sound with Stereo-Blaster Pro (Portronic/AMC): Afaik there was at least one demo disk (early version was single-sided only, later versions were double-sided), that contained some demo-software, namely the simple "Stereo-demos" (by AMC, side 1) and the "Stereoblaster-Demo" (by HU-Soft, side 2 if available). The Stereoblaster demo was written in Turbo-Basic and played back via Compiled-Turbo-Basic, it uses Chaos Music-Composer Sounds (*.CMC) and a few of these provide stereo effects, if equipped with a stereo-blaster-pro and a hifi-system. The simple stereo-demos included some programs written in Atari Basic, for example a (pong-like) bouncing ball and a flying helicopter. Equipped with a stereo-blaster-pro and a hifi-system, one could see the ball bouncing left and right and simultanously hear the sound fx on the left or right channel. The helicopter started at the left side and produced a loud sound on the left channel, when it was flying to the right side, the sound faded on the left channel and got louder on the right channel, until the helicopter disappeared (and the sound completely faded away). There were some more of these simple demos available, but I don`t remember them anymore.

- Stereo with two Pokeys: There already exist dozens of sounds and demos, that support this upgrade, most of these programs were made in Poland, but a few sound-demos were also made in other countries. Anyway, the following programs support stereo via two Pokey chips:

- Alf-Demo by the Unknown Base (Netherlands);
- Alpha-Demo by GMG (Slovakia);
- AMS-Stereo player by ??? (author unknown), USA;

(there are at least two AMS-stereo-players, that let you play
*.AMS sounds in true stereo or at least simulated stereo!);
- ARS-Mori 16k Intro by Tristesse (music shortened and ripped from
Drunk Chessboard by Infinity!), Poland of course;
- Ballada sound by DJ V / BK (Poland);
- Base 33 by AIDS (msx by Greg, Poland);
- Chaos Music Composer version x.x patched by ??? , Poland;
(=> the original version by Janusz Pelc / LK Avalon is only mono,
but there is a patch available, as well as various patched CMC
versions on the internet; thus *.CMC sounds can be generated in
stereo!);
- (many) *.CMC sounds created by one of the many stereo-versions of
Chaos Music Composer;
- Cogito-Demo by AIDS (Poland)
- Do you see the light? sound-demo by Roemer of UNO (Germany);
- Draconus, patched version by ANG and/or Micro Discount (NL/UK)
(the original version by Zeppelin games is only mono!);
- Drunk Chessboard by Infinity (music by X-Ray!), Poland;
- Dynakillers (Game) by GMG, Slovakia;
- First of All (sound) by Raster, Czech Republic;
- Impossible but Real Demo by MacGyver (Poland);
- King of Aggregat by X-Ray / Slight (Poland);
- Megaplayer Versions 1.6 and 2.0 by MacGyver (Poland)
(=> and thus all *.CMC, *.MPT, *.TMC, etc. sounds played with
this sound-player tool can be heard in true or simulated stereo!);
- Multi-Pro-Tracker 2.4 (various versions) by Jaskier/Taquart?
(=> thus *.MPT sounds can be generated in stereo!), Poland;
- (many) *.MPT sounds created by the stereo-version of Multi Protracker;
- Nazebany by DJ V / BK (Poland);
- Overload sound by X-Ray / Slight (Poland);
- Raster Music Tracker 1.x by Raster, Radek Sterba (a PC program
that creates mono/4-channels or stereo/8-channels *.RMT sounds that
can be played back on the A8 or any Atari 800/XL/XE emulator);
- (most) *.RMT sounds created by Raster Music Tracker;
- Stereo-Patch for Pokey Player by ??? (author unknown)
(=> thus all Pokey-Player / *.V sounds can be heard in stereo!);
- Stereo-Patch for Softsynth by Freddy Offenga (Netherlands)
(=> thus Softsynth will create stereo-sounds!);
- Stereo Patch for World of Wonders by Freddy Offenga (Netherlands)
(World of Wonders is a great Softsynth sound-demo!);
- Still Alive (TMC-sound) by Greg, Poland;
- Time sound by X-Ray / Slight (Poland);
- Theta-Music-Composer version 1.x by Greg (Poland)
(=> thus *.TMC sounds can be generated in stereo!);
- (most) *.TMC sounds created by Theta Music Composer;
- Vanity sound by Kuchara / Excellent (Poland) ;
- Worms (320k-Demo) by Datri, Czech Republic;
- Zybex, patched version by ANG and/or Micro Discount (NL/UK)
(the original version by Zeppelin games is only mono!);
- thats all what I found so far... (A.M.)

b) software for other sound enhancements:

- enhanced-sound with Covox: Afaik this upgrade will playback digitised or sampled sound in 8Bit resolution rather than in 4Bit resolution. The following programs support the Covox-Upgrade:
- Inertia 2.9, a MOD-player by MadTeam;
- Inertia 4.5, a MOD player by MadTeam;
- Protracker x.x, a MOD-editor and player by ???;
- NeoTracker 1.x, a MOD+NEO+... player by EPI/Allegresse;
- that's all I have found so far;
note that all programs (except neo-tracker?) will still work with pokey...;

Subject: 8.15) What games support online action via modem?

This section by Andreas Magenheimer.

- Modem Chess, a PD game in Basic by ???
- Modem-Battleships, a PD game in Basic by ???
- Tele-Chess, a PD game in Basic by ???
- probably some more games...

(I have also seen an advert from GCP in Analog or Antic, that listed the following games: The City, Cybertank, Cybership, Bio-War, Lords of Space; I am not sure if they are all available for the Atari, A.M.)

To play these games online, one would not only require an Atari computer, but also a modem, a modem-driver and/or a terminal program (like Kermit, Bobterm, Teleterm, A-Term, Ice-T, BBS Express Pro, etc.). See also the sections 7.8, 10.1 and 10.2 which tell you more about modem/terminal programs and modem hardware for the Atari...

Subject: 8.16) What programs support Atari computer networking?

This section by Andreas Magenheimer.

There are two different hardware add-ons which provide a "computer-network" (two or more Ataris linked together). Thus, there is software that supports either one or the other hardware (namely Gamelink-1 or Gamelink-2). The following software supports the networking hardware:

- Gamelink-1 (by Dataque):
- info-text about GL-1 and where to buy it, by Dataque;
- Tic-Tac-Two by J.Potter/Dataque, a tic-tac-toe clone;
- Modem-Battleships, patched by Rick Detlefsen for Gamelink-1;

- Gamelink-2 / Multilink (by Dataque & Bewesoft):
- info-text about GL-2 and where to buy it, by Dataque;
- info text about Maze of Agdagon demo, by Dataque;
- Maze of Agdagon demo (1 player only) by Dataque;
- documentation for Maze of Agdagon (full version) by Dataque;
- Maze of Agdagon (full version, 2-8 players) by Dataque;

- description of multilink/gamelink-2 hardware and schematics by
Bewesoft (two texts, one in czech and one in english; schematics
presented as an Atari Gr.8 picture for a) easy-2-computer hardware
and b) more complicated 2-8 computer hardware);
- Multi-Dash (2-8 players, XL/XE only) by Bewesoft;
- Multi-Race (2-16 players, XL/XE only) by Bewesoft;
- description of "how to program networking games for multilink
[gamelink-2] hardware" (text available in english and czech, with
lots of source codes and OS adresses/variables/...) by Bewesoft;
- Multi-Worms (2-8 or 2-16? players, XL/XE only) by Bewesoft;
- complete + documented source code for Multi-Worms by Bewesoft;
- "starter-kit" module to use in your own networking-games by Bewesoft
(free use of this module is granted by Bewesoft/Jiri Bernasek);

Subject: 9.1) How can I work with .arc files on my 8-bit Atari?

ARC.EXE for MS-DOS was released by System Enhancement Associates (SEA) around
1985. It will compress and store groups of files as one file, making it
easier and quicker to download programs and support files at once. Because of
the ease of use and availability of this program, it quickly became the
defacto standard for file archives on Intel-based IBM machines. Files
compressed and stored with ARC or a compatible utility are normally given the
filename extender ".arc".

The 8-bit Atari computers have several software utility options that are fully
compatible with ARC.EXE, the most important being:

Super UnArc 2.4 and Super Arc 2.4 - shareware by Bob Puff, released 01/31/89
Available:
http://www.nleaudio.com/css/files/superarc.arc (complete package + docs)

Also, SpartaDOS X includes a fully compatible ARC command for both creating
and extracting .arc files.

Subject: 9.2) What file formats for entire disks/tapes/cartridges are there?

It is now common, especially when working on Windows PCs or Macs, to work with
Atari software as files or "images" containing the data from an entire disk,
data cassette, or cartridge as duplicated from the native media for the Atari.

Here is a list of file formats, arranged by their associated filename
extensions. These are all filename extensions used to name files containing
entire 8-bit Atari floppy disk images, cassette tape images, or cartridge
images.

.DCM -Image format invented by Bob Puff for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.
DISKCOMM is at http://www.nleaudio.com/css/files/DISKCOM.ARC
DCM specs at: http://home.planet.nl/~ernest/diskcomm.zip

.ATR -Image format invented by Nick Kennedy, for his SIO2PC project.
Used with most 8-bit Atari emulators running on other computer
platforms. SIO2PC is at http://www.tcainternet.com/wa5bdu/

.XFD -Image format invented by Emulators Inc, for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used with ST Xformer and PC Xformer emulators.
Xformer is at http://www.emulators.com/

.PRO -Image format invented by Steven Tucker, for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.
APE and APE ProSystem are at http://www.atarimax.com/

.SCP -SpartaDOS SCOPY image file. SCOPY was a utility by ICD.

.DI -Image format invented by Kolja Koischwitz & Christian Kruger for their
800XL DJ emulator for the Atari ST.

.CAS -Cassette image format invented by Ernest R. Schreurs, for his
Digital Cassette Image system (includes CAS2SIO, WAV2CAS, and CAS2WAV
MS-DOS utilities. See: http://home.planet.nl/~ernest/

See also:
Atari Disk Image FAQ (Steve Tucker)
http://www.atarimax.com/ape/docs/DiskImageFAQ/

One tool for converting among all of these disk image formats is:
Acvt v1.07 by Jindrich Kubec, found at http://jindroush.atari.org

---

Subject: 9.3) How can I copy my copy-protected Atari software?

Russ Gilbert writes:

Almost all commercial software for the A8 is/was copy protected. For boot
disks, this usually involved a large number of special formatting that
couldn't be copied using ordinary sector copiers. Usually the boot process
involved checking to see if a certain sector error occurred, then proceeding.
If the error did not occur, the disk was a copy and would not work.

For carts, usually the method of protection was to write to the cart area of
memory and see if the value changed. If the value changed, the cart program
was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at
which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption,
which must be decrypted before the program can run. This to make more
difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of
protected software for the A8. The most common way to defeat copy protection
was to disassemble the software and revise sections of code so that the copy
protection was defeated. A software with defeated copy protection is called a

'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE ProSystem, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a cable, called the SIO2PC cable, that connects the A8 13 pin serial port to a serial port on the IBM PC clone. To make 'Pro' images, a special adapter cable is needed, not just the 'standard' SIO2PC cable. The 'Pro' image can 'capture' the copy protection of an original commercial disk. The 'Pro' image can then be loaded into an A8 using the APE registered version software, thus backing up your original disk software. Note the 'Pro' image will only be of use to person(s) owning registered APE software and 'Pro' adapter cable.

Subject: 10.1) What programs can log in to other computers via modem?

Here are some of the more popular PD/freeware/shareware terminal emulator and related programs available. Use one of these programs for accessing a dial-up Bulletin Board System (BBS) with your Atari, or for accessing a dial-up "shell account" with your Internet Service Provider (ISP). Dial-up shell accounts are no longer widely available here in the 21st century! (There is no general-purpose PPP capability for the 8-bit Atari that I am aware of.)

ATAR-Z-MODEM 1.2, 5/29/94, shareware by Larry Black
Emulates: n/a
Text: 40 columns in gr.0
File Xfer: ZMODEM download
Autodial: No
Backscroll buffer: No
Capture-to-disk: no
Summary: Intended to be used as an external ZMODEM receive utility in conjunction with other terminal programs, especially BobTerm
http://www.umich.edu/~archive/atari/8bit/Telecomm/Protocols/atzmod12.arc

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 release that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
Available: http://www.nleaudio.com/css/ (version 1.21)
ftp://ftp.spudster.org/pub/atari/cth/terminal_programs/BOBTM122.ARC (com only)
http://people.a2000.nl/becotel/archive/bobt123.arc (1.23)

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
ftp://ftp.spudster.org/pub/atari/cth/terminal_programs/FLICK051.ARC

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
Available: http://www.cs.huji.ac.il/~itayc/

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: k65v37.arc ; k65doc.arc - docs ; k65src.arc - source

OmniCom by CDY Consulting (David Young)
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit
filename: omnicom.arc

PabQwk 2.0, 1 Feb 1994, shareware by Low-Budget Productions (Pab Sungenis)
Requires: 128K XL/XE
Emulates: n/a
File Xfer: QWK upload/download
Summary: The Professional QWK reader for the Atari 8-bits. (QWK is a
packet format created in the IBM BBS community for reading mail
offline.)
http://people.a2000.nl/becotel/archive/pabqwk20.arc

Term80 1.6 (8.25.95), by CTH Enterprises (Tom Hunt)
Requires: MIO or Black Box
Emulates: ANSI
Text: 80 columns in gr.8
File Xfer: XMODEM receive, YMODEM send/receive
Autodial: Yes
Brackscroll buffer: No
Capture-to-disk: Yes
Summary: Designed for calling IBM ANSI BBSs at the highest possible
speeds supported by the MIO and Black Box (14.4 Kbps)
Available: http://cth.dtdns.net/Featured/term80/term80.html

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: vt850b1.arc

Subject: 10.2) What programs can I use to host a BBS on the Atari?

The 8-bit Atari was particularly popular for hosting a dial-up Bulletin Board System (BBS). Uploading/downloading files, online messaging, even online gaming services can all be hosted on an 8-bit Atari operated as a dial-up BBS.

This section attempts to list all BBS programs for the Atari. Of these, BBS Express! Professional and Carina II BBS seem to be programs that stand up well even today.

Contributors to this section include: Winston Smith, Steven Sturza, Chad Hendrickson, Don Fanning, Matt Singer, Pete Davis, Jeff Williams

o AMIS BBS -- The Atari Message Information Service, public domain.
The "granddaddy" of BBS programs for the 8-bit Atari.

The AMIS BBS was written in BASIC by people from the Michigan Atari Computer Enthusiasts. It included designs for a ring-detector. You needed a sector editor and had to allocate message space by hand, hex byte by hex byte.

Several versions of AMIS:
* Standard AMIS
* MACE AMIS - from the Michigan Atari Computer Enthusiasts
* Fast AMIS
* MPP AMIS by Matt Pritchard
* TODAMIS 1.0, for 1030/XM301, 1986, Trent Dudley

o ATABBS -- Rod Roark writes (3/12/03):
This is really straining my memory -- don't recall exactly when I wrote the thing (maybe '80 or '81), but as far as I know ATABBS was the world's first BBS for the Atari 400/800.

I ran it out of my condo in Atlanta on a 48K 400 with an 80K floppy drive and a 300 bps Hayes Smartmodem. The 48K memory module was a third party add-on, not Atari's.

It was written in Atari BASIC with a few bytes of machine language thrown in.

o ATKeep -- An Atari 8-bit version of CITADEL BBS, by Brent Barrett
ATKeep is a Citadel-like BBS system for eight-bit Ataris. ATKeep runs under SpartaDOS and requires BASIC XE and 128K of RAM. Originally "MBBBS (Message Base Bulletin Board System) 1.0, March 24th, 1986" MBBBS was changed to Atari Keep, or, ATKeep for short, around version the time version 4.0 was released (June 15, 1986).

ATKeep 7.0 finally took the aide and cosysop commands out of a menu section and put them into extended commands, where they belonged. It also added a SYSOP level command set. Users were no longer "users" "aides" or "cosysops," they had become level "A" (SYSOP) through level "Z" (READ ONLY). The system had become extremely complex. Public, hidden OR password protected PRIVATE rooms. Each room now had its own access level (thus keeping people of lower level from getting in EVEN if they knew the room name). Each room was assigned a RWRT (or Read WRiTe status), which determined who could enter messages in it, and whether or not public or private messages, or both were to

be allowed.

Before version 7.0, ATKeep only worked with the Atari 1030 or XM301 modems.
ATKeep 7.0 was rewritten to accomodate the 850 or PRC interface allowing use
of any Hayes compatible modem.

ATKeep version 7.50 was released (1987), was version 8 released?

o BBCS -- Bulletin Board Construction Set, by Scott Brause/Antic, 1985
A machine language program, developed as the Jersey Atari Computer Group
(JACG) BBS system.

BBCS was known for it's great flexibility. The sysop was offered easy
customization by the use of menus. Many BBSes before it required that you had
to actually change the BASIC code in order to customize your BBS.

Unfortunately, it also suffered from a reputation for stability problems.

o BBS Express! -- 1986, Leith Ledbetter/Orion Micro Systems
Written in compiled Action!. 1030/XM301 and 850 versions.

o BBS Express! Professional ("Pro!")--6.0b 1999, Lance Ringquist/Video 61
Originally by Keith Ledbetter/Orion Micro Systems.
See also http://cth.dtdns.net/pro/pro1.html

Written in 100% machine language.

Requires XL/XE, SpartaDOS 3.2+, hard drive highly recommended, or at least a
large ramdisk. R-Time 8 is fully supported.

o Carina II BBS -- v2.7 (1995), David Hunt/Shadow Software
Carina II was originally developed by Jerry Horanoff.

Requires an XL or XE computer, at least 500K of storage capacity (including
ramdisk and drives), and SpartaDOS version 2.3 or greater.
Recommended: 192K ramdisk or greater, and an R-Time cartridge.
Fully supported: An MIO interface and a hard drive.

More Carina II information and links:
http://jybolac.virtualave.net/carina/

Pete Davis writes (15 Aug 2002):
Carina was a pretty powerful BBS system. Though it was written in BASIC (with
a number of machine language routines), it was expandable and had was able to
load new BASIC programs with the BBS running. In fact, it was quite modular
and would load different sections of the BBS at runtime. I actually used it
when I ran a BBS some time back.

o Carnival BBS -- essentially AMIS with an overlay to allow for private
messages and passwords.

o FoReM BBS -- Friends of Rickey Moose BBS. By Matt Singer.
At the time, there were a lot of BBSs around called things such as "FORUM-80"
and "BULLET-80", ergo the name. FoReM BBS was the first truly RBBS-like BBS
for the ATARI 8-bit. It was programmed in BASIC and was somewhat crashy. I

think that this is the great-grandparent of the FOREM-XE BBSs that survive today.

Matt Singer writes:
FoReM BBS derived from an early AMIS. When multiple message areas were added the name was extended to FoReM 26M. Then, When OSS released BASIC XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most of the Assembler routines (where is he now?).

o FoReM XL BBS -- by Matt Singer.
FoReM BBS updated to take advantage of BASIC XL from OSS.

o FoReM XE BBS -- by Matt Singer
This version of FOREM BBS requires the commercial BASIC XE cartridge in order to run. It is in the public domain and can import and export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only, control ATASCII graphics are reserved for message data-structure bytes).

o FoReM XE Professional BBS / FoReM XEP BBS -- by Len Spencer
A re-write of FoReM XE BBS, last version was 5.4, Jan 5 1993.
FXEP requires an XL/XE computer with at least 128k of memory, the BASIC XE cartridge from OSS/ICD, SpartaDOS 3.2 (this program will NOT work with any other version), and at least 500K of storage.

FXEP is in the public domain, http://members.aol.com/lenspencer/

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston, Massachusetts, USA, area.

"1983: Nite-Lite B.B.S. goes on the air. (Was it running A.M.I.S. ?) It is called "Nite-Lite" because the computer monitor casts an eerie glow about the room. 1984: Paul Swanson writes his own BBS hosting software for the ATARI 6502 8-bit computer. He names it "Nite-Lite". The Nite-Lite BBS hosting software goes on to be the most successful commercial BBS software ever written for the ATARI 6502 8-bit computer. 1989: Nite-Lite BBS puts in a second line. (MichTron boards eventually take the place of all of the ATARI Nite-Lite boards.)" - Winston Smith

This BBS was the first to support a RAMdisk, which Paul Swanson called a "V:" device for "virtual disk". This BBS was written in Atari BASIC and required a joystick hardware "dongle" device. This was notable as being one of the first Atari 8-BIT BBSs that could actually go for a week without having to be rebooted. Pointers to the message base were kept in an Atari "very long string" (for which Atari BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o OASIS (the commercial version) / OASIS Jr. (the pd version)
Originally by Ralph Walden, then Leo Newman took it over, followed by Glenda Stocks/Z INNOVATORS, then Alf (Jeff Williams).

All machine language. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal

program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". An excellent message system, and a complex file system. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). OASIS IV performs networking.

Glenda Stocks writes at http://world.std.com/~snet/glenda.htm :
I purchased the source code rights to OASIS and began marketing the BBS software to Atari 8-bit enthusiasts around the world. I felt that I had the superior BBS software because I had programmed in the ability to run external programs, including online games and user surveys. I also had added color prompts for IBM clone users who called Atari boards running my OASIS software. Sometime in 1991...I sold the rights to OASIS to a man in Canada..

Jeff Williams ("Alf") writes: (12/6/02)
OASIS was around prior to either PRO or BBS Express IIRC. I don't know when exactly it showed up, version 3.09 was the first one I remember seeing. What made it nifty was it was very fast, being all assembler, and having some different features that things like Forem & Carina didn't have. Compared to something like Forem MPP at the time, it was kind of amazing.

Ralph Walden sold it to Glenda Stocks, who chopped it up into modules and sold it as ver 4.7. PRO was out by then, and was a much more complete offering imo. Glenda wrote some modules for 4.7, but it never really went anywhere because the architecture was so cramped with her changes.

Eventually she gave up and sold me the source. I looked it over and realized it was a mess and nothing was going to happen with it. I worked on a version 5 for a while, but never made much progress.

o SMART BBS -- by Marco Benton.
This program is written entirely in BASIC. It expects to be running under a SpartaDOS environment. This BBS program uses a "modem clock string" rather than an R-Time 8 cartridge in order to retrieve the current time. It also comes with an Atari BASIC game door called "Sabotage".

Subject: 10.3) How can I read/write 8-bit Atari disks on an MS-DOS PC?

There are several programs that allow an MS-DOS system to work with an Atari-format 5.25" diskette. Each of these work with the Atari SS/DD 180K format, so you'll need an Atari DOS and disk drive capable of this format.

#1 Choice:
AtariDsk V1.2 (c) 95-12-09 by HiassofT (Matthias Reichl)
http://www.horus.com/~hias/atari/

#2 Choice:
MyUTIL by Mark K Vallevand. Based on Charles Marslett's UTIL.
http://www.umich.edu/~archive/atari/8bit/Diskutils/Transfer/myutil.zip
Includes SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

Other similar utilities:
ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
www.umich.edu/~archive/atari/8bit/Unverified/Diskutils-redist/atario21.arc
SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
http://www.umich.edu/~archive/atari/8bit/Diskutils/Transfer/sr.arc
UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks.
http://www.wordmark.org/

Here's some advice on using the above utilities from Hans Breitenlohner:

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width.
The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo sums it up this way:
So a basic rule of thumb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above mentioned utilities work with SS/DD 180K Atari-format disks or
SS/DD 180K SpartaDOS disks, the following combination of utilities has been
used successfully to read SS/SD 90K Atari-format disks. So if you only have
standard Atari 810 and/or Atari 1050 drives, you could look into:

AnaDisk -- now a product of New Technoligies Inc. (NTI)
See: http://www.forensics-intl.com/anadisk.html
The current version is "not made available to the general public" (!)
Previously a product of Chuck Guzis @ Sydex, http://www.sydex.com/
Older versions available: http://ch.twi.tudelft.nl/~sidney/atari/
- Reads/Writes "any" 5.25" diskette

DeAna by Nate Monson
Available: http://ch.twi.tudelft.nl/~sidney/atari/
- converts AnaDisk dump files from Atari format

See http://ch.twi.tudelft.nl/~sidney/atari/ for tips on using this
combination of utilities.

Preston Crow writes:
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.

For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 10.4) How can I read/write MS-DOS PC disks on my Atari?

Several 3rd-party hardware upgrades add the capability of working with
MS-DOS diskettes to your Atari system:

Happy 1050 upgrade for the Atari 1050
-- read/write 180K 5.25" MS-DOS floppies

CSS XF Single Drive Upgrade for the Atari XF551
-- replace the 5.25" mechanism with a 3.5" mech.
-- read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFsingdrup.htm

CSS XF Dual Drive Upgrade for the Atari XF551
-- add 3.5" drive without losing the 5.25" drive
-- read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFdualdrup.htm

CSS Floppy Board, for the CSS Black Box
-- adds support for PC 720K and 1.44MB 3.5" drives to your Atari system
-- adds support for PC 1.2MB and 360K 5.25" drives to your Atari system
-- read/write 5.25" and 3.5" MS-DOS disks in your PC drives with your Atari
see: http://www.nleaudio.com/css/products/floppy.htm

Subject: 10.5) How do I transfer files using a null modem cable?

This section by Russ Gilbert.

Q: How do I connect two computers using a null modem cable?

A: You need a term program and RS 232 ports on both computers. The RS 232 ports need to be connected together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be connected. Just cross the transmit and receive lines and join the grounds together. Transmit is pin #2, receive is pin #3 and ground is pin #7 on the 25 pin port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin #3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go to the left 1 to 13 then #14 is under #1 and left again so that #25 is under #13.

Most term programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not. I have only used 'Procomm 2.4.3' (the last shareware version of Procomm) on the PC and BobTerm on the Atari, but other term programs may work.

To check your null modem connection, start both PC and Atari term programs, set baud to 2400 or 4800 on both computers. No parity, 8 data bits, 1 stop bit on the PC. Be sure to use the correct COM port on the PC. Go to 'terminal' mode and you should now be able to type on either computer and see it on the other screen. To accomplish a file transfer, use Y-modem probably from BobTerm, rather than X-modem. X-modem will often append bytes to a file transfer, an undesirable event. There is also a very nice Z-modem recieve program for the Atari, called ATAR-Z-MODEM by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors (Radio Shack) some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modems and plugging in the null modem cable into the two modem cables. This also avoids the confusion of variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem

cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: Connection, MIO, Black Box or similar device that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you need the flow control lines and Atari term software that has flow control built in. You also need an MIO or Black Box, which uses the PBI (parallel bus). A high speed cable would need not only XMT, RCV, and GND, but also flow control lines. I suggest a commercial null modem from computer store to ensure correct lines. A null modem is a small adapter with the correct lines already crossed. I don't know how to correctly connect the CTS, RTS, DTR, DSR, CRX lines for a high speed null modem. With a null modem, you just plug it into the 25 pin connectors of the two modem cables you might already have connected to your Atari and PC or Mac. You may need a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here: (Figure out or look for pin numbers on the ports.) Note that these are pin assignments, and NOT null modem connections with the XMT, RCV crossed and GND straight thru.

Atari 8-bit PC AT 25 PC AT 9 pin
---
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3
4. RCV 3 2*
5. GND 7 5
6. DSR 6 6
7. RTS 4 7
8. CTS 5 8
9. No connect? shield RI
22 RI

Note: * above indicates the difference between an AT 9 pin
and a Atari 8-bit 9 pin cable connector. eg. If you check
continuity from pin 3 of 25 pin end and it goes to pin
4 of nine pin end, you have an Atari serial cable. If pin
3 of 25 pin goes to pin 2 of 9 pin end, you have a PC
serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

Subject: 10.6) How can my Atari use my PC's HD using SIO2PC or Atari810?

SIO2PC
======
From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC
compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari
programs could be stored on the PC's hard (or floppy) drives. It turned out to
be quite successful. About 95% of my work was in the software, but a hardware
device to convert logic levels was also necessary. This device is now commonly
referred to as an SIO2PC cable.

Features:
- Emulates 1 to 4 Atari disk drives
- Store your Atari files on PC hard or floppy drives
- Boot from the PC, real drive not needed to start-up
- No software or drivers required for the Atari;
no conflicts: use your favorite DOS
- Twice as fast as an Atari 810 drive and more reliable
- Co-exists with real drives in the Atari daisy chain
- Compatible down to the hardware level: use sector copiers, etc.
- Print-Thru captures Atari print-out and routes to PC's printer
- Convert Atari files to PC files and vice versa
- 1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy
http://www.cswnet.com/~nkennedy/

Another source for building SIO2PC cables is Clarence Dyson's page at
http://www.wolfpup.net/atari/atari.html

Atari810
========
Atari810 1.4d, by Dan Vernon, is a disk drive emulator in the tradition of
SIO2PC, for the Windows NT/2000/XP platform
http://retrobits.net/

Subject: 10.7) How can my Atari use my PC's HD, printer and modem using APE?

David A. Paterson writes:

"Steven J. Tucker took SIO2PC one better and wrote new software.
The Atari Peripheral Emulator (APE for short):

- lets your PC act as high-speed drives.
- It lets you print to your PC printer.
- And it lets you use your PC modem on the 8-bit."

http://www.atarimax.com/

Subject: 10.8) How can I connect my 1050 to my PC with the APE ProSystem?

The APE ProSystem goes beyond APE. The ProSystem has two components:

- The program PROSYS.EXE is used to create the protected and unprotected disk images which are then used by APE.

- The ProSystem hardware is a cable designed to allow direct connection of a stock 1050 disk drive directly to a PC's serial port for use by the PROSYS.EXE software.

http://www.atarimax.com/

Subject: 10.9) What about interoperating with the Apple Macintosh?

Mark L. Simonson keeps a nice set of web pages which he calls "Mac/Atari Fusion: Atari 8-bit Resources for Mac Users." Please visit:

http://www2.bitstream.net/~marksim/atarimac/

Subject: 10.10) Are there 8-bit Atari tools for the Commodore Amiga?

'551conv', freeware by Achim Hartel:
Converts a real Atari-800-disk, .xfd-image or .atr-image into a real Atari-800-disk, .xfd-image, .atr-image or extracts the files of the disk (-image). All 4 formats of the XF551-station supported: Single, Medium, Double, Quad. Version 1.03.

Subject: 11.1) How did Atari get its name?

Graham Thornton types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are theirs, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong.

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 11.2) What is the History of Atari?

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor.

1979
Atari files with the USPTO for a patent for a "Data processing system with programmable graphics generator" (the 400/800 computer system) on January 8, 1979. Inventors listed:
Mayer, Steven T. (Auburn, CA);
Miner, Jay G. (Sunnyvale, CA);
Neubauer, Douglas G. (Santa Clara, CA);
Decuir, Joseph C. (Mountain View, CA)

The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand-built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirement had been met.

The first "real" consumer units were shipped in Nov. of '79 and were 400s to Sears followed very shortly by 800s."

All Atari computers are tested at the factory by a master computer called the Atari Sentinel System.

1981
From Atari Connection magazine:
"At the National Computer Conference in Chicago on May 5, 1981 Atari announced that the 8K Atari 400 was being discontinued and that the price on the 16K version was being reduced to $399."

The USPTO grants U.S. Patent 4,296,476 to Atari on October 20, 1981 for the 400/800 computer system. Read the full text of the patent here: http://makeashorterlink.com/?M2561456

November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL.

1984
Warner Communications sells the Consumer Electronics and Home Computer divisions of Atari Inc. to Tramel Technology on Monday, July 2.

Atari Corporation is formed by Tramel Technology and its products marketed under the Atari brand.

{ Warner sells the AtariTel division of the former Atari Inc. to Mitsubishi Electric, and the former AtariTel becomes Luma Telecom.

A complete line of cutting-edge telecommunications products had been under development at AtariTel since 1981, but no products had been released under Atari.

However, the Atari Videophone was nearly completed, and the product eventually surfaced as the Mitsubishi Luma Video Phone, aka Luma-Phone, aka LumaPhone. "The Visual Telephone"

Mitsubishi has since shut down Luma.
}
(
Warner also initially retains the arcade division of the former Atari Inc., and renames it Atari Games Corporation. Soon thereafter, Atari Games is a private, independent entity, though Warner remains a major investor.

Atari Games inherits Atari copyrights/trademarks/patents for use in the coin-operated arcade video game market.

1987
Atari Games creates the Tengen label for the purpose of marketing games for home game systems (potentially competing directly with Atari Corp.)

1993
Atari Games is (re-)purchased by Time Warner.

1994
Time Warner consolidates Atari Games into Time Warner Interactive. Use of both the Atari Games and the Tengen brands are discontinued.

1996
On March 29, 1996 WMS Industries (Williams, Bally and Midway) completes its purchase of Time Warner Interactive. Upon the sale, Time Warner Interactive adopts the Atari Games name and logo, and Atari Games is made a division of Midway Games.

1998
In April of 1998 WMS spins off to shareholders its entire stake of Midway Games, making Midway Games essentially an independent entity. Atari Games remains a division of Midway Games.

1999
Atari Games releases San Francisco Rush 2049. This turns out to be the last coin-operated arcade game sporting the Atari Games name and logo.

January 2000: Atari Games is renamed Midway Games West, and games produced by the group will sport the Midway Games brand.

June 22, 2001: Midway Games announces it is exiting the coin-operated arcade video game market; its game development efforts will now be focused on games for home game platforms. The Midway Games West division lives on, developing games for home systems for Midway Games.

February 7, 2003: Midway Games shuts down their Midway Games West division.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985.

According to Atari Explorer magazine, the 130XE was engineered by Jose Valdes.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system.

1992
Atari (US) officially dropped all remaining support of their 8-bit computer line on January 1, 1992. (Some 800XE's were still being manufactured in China in 1992.)

1996
On July 31, 1996, in a "reverse merger," Atari Corp. purchased JTS, with the new parent company taking the JTS name while Atari was immediately designated a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which was a subsidiary of Hasbro, Inc., for $5 million in cash.

(JTS filed for Chapter 11 Bankruptcy Protection on December 11, 1998, and then converted it to Chapter 7 on February 28, 1999)

Hasbro Interactive produced games for several platforms, including PCs running MS-Windows. Some of Hasbro Interactive's games, including several re-makes of classic Atari titles, were marketed under the Atari Interactive name and logo. Atari Interactive was termed "a Hasbro Affiliate."

Games produced by "Atari" under Hasbro ownership included:
Atari Arcade Hits 1 & 2, Breakout, Centipede, Missile Command,
Nerf ArenaBlast, Pong, Q*Bert, The Next Tetris, Atari Greatest Hits

2001
On January 29, 2001 Infogrames Entertainment announced completion of its acquisition of Hasbro Interactive from Hasbro, renaming the subsidiary "Infogrames Interactive." The purchase included the Atari titles and intellectual properties (known at Hasbro as "Atari Interactive").

Between 2001 and 2003 Infogrames placed the Atari brand on some of its "premiere" gaming titles.

2003
Beginning May 7, 2003 Infogrames Entertainment adopts the Atari brand and registered trademark for all operations, effectively changing the name of the entire company to Atari.

Additionally, the Company's wholly-owned subsidiary, Infogrames Interactive, Inc., which develops many of the game derived from the Hasbro line of board games, changes its name to Atari Interactive, Inc.

TODAY = http://www.atari.com/

Infogrames Entertainment
========================
Founded in 1983 by Bruno Bonnell and Christophe Sapet, Infogrames Entertainment SA today has more than 1,800 employees worldwide (approximately 60% in Europe and 40% in the U.S.). A publicly traded company, Infogrames Entertainment SA (Euronext: 5257) is one of the top five publishers of interactive entertainment software in the world and is widely regarded for developing and distributing quality games for the mass entertainment audience.

Infogrames SA comprises two main subsidiaries: 1) the U.S. based, publicly traded Atari, Inc. (Nasdaq: ATAR); and 2) Atari Europe, which represents the

Company's original operations. Atari, Inc. includes the former GT Interactive; Atari, Inc. also manages Atari Interactive, Inc. (the former Hasbro Interactive) on behalf of its parent company.

2004.04.30 Vladimir Tichy, Atart program version 1.07.0

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
```

listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no
guarantees. Information of this nature constantly ages; therefore, the
information contained in this list is constantly updated. Please use the
latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to
send me updates that correct errors that you find. If you use this
list, please do your part in keeping it useful for everyone!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

>Thanks, RoyE and Slor (James). I actually should thank Slor two times
>(the second one for offering his Mapping the Atari!).

Almost one month ago (!) I tried these solutions, but without success.
Now that I have some spare time again, I'd like to understand why.
Here is what I did:

1) MyPicoDos:
-created a hard disk image (65535), then prepared the disk (mydos "O"
option, then "I"nitialize. The hard disk works properly (i.e. boots up
with mydos if I write the dos files to it, etc.)
-ran Mypdos.com from mydos. Wrote the files to the hard disk
(mypdos.sys, if I'm not wrong).
When I try to boot up, I get a "boot error".

2) Getting a boot menu with APE
If I set the hard disk (obviously without dos files) to d1:, when I
turn on the computer I get a boot error. I'm running the trial
version.

I don't understand where I'm going wrong...

Any suggestions?

Gianfranco

There is an option in APE, called PC-Mirror (S in DOS version). Setting
D1: as a PC mirror drive will give you a boot menu where you can run
executables directly from the hard drive of your PC.

"The 1st Annual 1 to 2K Classic Text Adventure Competition"

Website: http://panks.freeshell.org/advcomp.html

Is it possible to write a text adventure in under 2K of RAM? Some people have tried, and some have succeeded.

I would like to officially announce the formation of The 1st Annual 1 to 2K Classic Text Adventure Competition. I will be accepting BASIC, C/C++, Fortran and Assembly language submissions for 1 to 2K text adventures written for the following computing platforms: Commodore 64/128/+4/Vic-20/PET, TI 99/4A, IBM PC/PCJr, Atari 400/800, Apple II/IIe, Sinclair, TRS-80, Color Computer, Acorn, Tomy Tutor, Linux, Mac and Windows/DOS.

Please submit your 1 to 2K adventure games to me, source code format only. The competition officially begins on June 28, 2004, and runs through September 29, 2004. I will post all submissions, regardless of when they were submitted, and then review them and post grades on this page on October 7th. Good luck! =)

Sincerely,

Paul Allen Panks

How about 128 bytes of RAM? I already have one of those. It needs 4K
of ROM, though.

It's not for one of the listed platforms, though.

Adam

2419. Action manual

Newsgroup: comp.sys.atari.8bit
Date: 2004-06-29 03:38:02 UTC

Can anyone tell me where I can get a complete copy of the OSS Action!
manual? I haven't had any luck searching the net and it appears as
though none of the remaining Atari vendors sell Action! any longer.

Thanks,
Dave

lol

But it's not a _text_ adventure. The only text in the game is even hard
to find...

bye

Hi Paul,

I see the challenge in attempting to put together a very, very small
adventure and this should be fun.
Is D64 image of a basic program suitable for the source code?

Scott.

I think the idea is to be like the old BASIC "one liner" competitions. The
point was not how good the programs were, it was that they worked at all!

Anyone who ever played any of the early Scott Adams text adventures would
know just how much you can do in a trivial amount of RAM. (Admittedly more
than 1-2K!)

I can't speak on behalf of Paul but its just a challenge to see what people
can come up with. Although having a second competition with an increase
memory size of 8k, 16k or more would be great.

Scott.

Sounds like fun. I think I might have a go at a game for the Spectrum.
My creative writing skills aren't really up to much though!

Like Gene Wirchenko, I'd also like to know whether the 2K limit is on
the source or the binary. I personally think it would make sense for the
limit to be on the size of the binary for submissions intended to be
compiled/assembled, and on the source for interpreted submissions, with
any dynamically-allocated space used for variables or temporary storage
not included in the limit (it would start to get annoyingly difficult to
police variable usage when you're at the mercy of platform-specific
garbage collection, etc -- and this is supposed to be fun, right?).

[rec.games.int-fiction removed -- I think that newsgroup is intented for
discussing games that actually exist!]

This does sound like fun. Actually right at this moment I'm writing a
random maze adventure game on my HP49g+. It a old conversion of a game
I written for the c64 years and years ago. IIRC it was quite a bit over
2K tho.

Oh well, back to writting.

How about this:

10 PRINT CHR$(147);:PRINT"YOU ARE IN A ROOM."
11 PRINT "WHAT DO YOU WANT TO DO NOW";:
12 INPUT A$:IF A$=""THEN GOTO 12
13 PRINT "I DON'T UNDERSTAND THAT..."
14 GO TO 11

Would that win? ;)

Shaun.

FWIW: The Action! manual was pretty bad. You'd be better off just getting the Action! PD runtime package to find out keywords and looking at a few programming examples. You might want to search for the Action! tutorial that is floating around.

Even with the manual I couldn't figure out what was going on with the cartridge until I took a C programming class and got the skinny on structured programming and reusable subroutines.

Hmm,
for MypicoDOS always try the normal/slow version when running it on a harddisk. Next, if you have written Mypicodos (PicoDOS.SYS) to disk/harddisk, there is no need to have a DOS on this disk also (so, delete DOS.SYS and DUP.SYS and if nescessary, write the PicoDOS.SYS file again). THe DOS is only required to create the Picodos.SYS file. Last not least set your harddisk partition to drive 1 to boot it and make sure, that no other drive (floppy disk, harddisk, etc.) already uses that drive spec. If it still does not work, then you might have a problem with your harddisk interface or the harddisk (read the docs again on how to setup a harddisk partition and make it bootable; maybe you should also read the Mydos docs again to setup the HD properly)... -Andreas.

Yep,
the XC-11 behaves like the XC-12 data recorder. It is only different in
design - and most of all it has a built in SIO cable plus a separate
SIO, so it needn`t end the SIO chain (like the XC-12)... -Andreas.

http://www.math.tu-berlin.de/~thor/atari++/

There, on the page, download

os++.tgz

This is a replacement Os. Its boot sequence alters in two
points, though: 1) there's a built-in file management system
that is bootstrapped if no usable boot sector is found, and
2) there is automatic bootstrapping for the 850 interface box
in ROM.

Oh yes, and support for autobooting "parallel port" devices
for the XL series is also missing, due to lack of documentation.

So long,
Thomas

The PBI device routines are documented/known enough, so that there are PBI floppy drives (KARIN MAXI is such one) and PBI hard drives (several IDE interfaces, actually, at least two, for XL/XE).

I'm looking for the DDT and/or BUG/65 manuals. If you find the
Action! manual and happen to see these others (also by OSS), please
let me know. Short of finding the manuals, could someone post a
quick-reference of commands and syntax for either/both of these
debuggers?

Isn't that the complete source code for Westfront PC? :)

Well, it's ages since I tried to write *anything* in BASIC, but I
managed to find a copy of QBASIC and lash up the following (1,851
bytes of source code):

```
10 R$ = "You are chained to a bench in a cave, watching shadows on
the wall. "

20 C$ = "The chains don't look very strong. ": C = 0

25 C1$ = "You are chained to the bench; you can't move. "

30 S$ = "The shadows don't seem very real. "

40 B$ = "It's just a plain wooden bench. "

45 W$ = "The wall is rough, with shadows cast on it. "

46 RR$ = "IN A CAVE" + CHR$(10) + CHR$(10)
```

```
50 CLS : PRINT RR$; R$

60 INPUT ">", z$

70 GOSUB 100: PRINT : GOTO 60

100 z$ = LCASE$(z$): i$ = LEFT$(z$, 1)

110 IF i$ = "q" THEN PRINT "Thanks for playing!": END

120 IF i$ = "l" THEN PRINT RR$; R$: RETURN

130 IF i$ = "b" AND INSTR(z$, "chain") THEN GOSUB 1000: RETURN

135 IF LEFT$(z$, 3) = "exa" THEN i$ = "x"

140 IF i$ = "x" AND INSTR(z$, "chain") THEN PRINT C$: RETURN

150 IF i$ = "x" AND INSTR(z$, "shadow") THEN PRINT S$: RETURN

160 IF i$ = "x" AND INSTR(z$, "wall") THEN PRINT W$: RETURN

170 IF i$ = "x" AND INSTR(z$, "cave") THEN PRINT R$: RETURN

180 IF i$ = "x" AND INSTR(z$, "bench") THEN PRINT B$: RETURN

185 IF LEFT$(z$, 3) = "go " THEN i$ = MID$(z$, 4, 1)

190 IF i$ = "e" OR i$ = "n" OR i$ = "w" THEN GOSUB 2000: RETURN

200 IF i$ = "s" THEN GOSUB 2100: RETURN

900 PRINT "I don't understand": RETURN

1000 IF C = 0 THEN PRINT "You break the chain and stand up. ": C =
1: C$ = "The chains are broken. " ELSE PRINT C$

1010 IF C = 1 THEN R$ = "You are standing in a cave, with an exit to
the south." + CHR$(10) + "Shadows flicker on the north wall. "

1020 RETURN

2000 IF C = 0 THEN PRINT C1$ ELSE PRINT "You can't go that way. "

2010 RETURN

2100 IF C = 0 THEN PRINT C1$: RETURN

2110 PRINT "You walk out of the cave into the sunlight"

2115 PRINT "and discover that there's a real world out there!"

2120 PRINT "You have been liberated from the world of illusion!":
PRINT

2130 PRINT "*** YOU HAVE WON *** "

2140 END
```

The "parser" (if it can be called that) is *extremely* primitive and
will probably produce quite bizarre responses to unanticipated
commands, but at least it responds correctly to the anticipated
ones!

I have the original manual for my MAC/65 with DDT cartridge. I imagine I
could make you a copy of the DDT pages. Drop me a line if that will help.

r.a.i-f is rec._arts_.int-fiction. That is not the same group as
rec._games_.int-fiction. raif is for discussing the creation of the
games; rgif is for discussion on playing them.

Yes, all will be available for download on my website, with pictures.

The 2K limit can be for either the source code or exe format (EXE,ELF,PRG,BIN,OBJ,etc.). So you can have an 8K source, so long as it reduces to no more than 2.9K EXE,ELF,PRG,BIN,OBJ,etc.

Here's an example 8k adventure to get everyone started:

```
5 REM The Melarkian - By Paul Panks (dunric@yahoo.com)

Thanks Shawn, it works perfectly now. It was my silly mistake to think
it would work with drive images too.

Andreas,

I don't have the dos.sys and dup.sys on the _virtual_ hard disk (I'm
using APE trial). I just wrote them to check if everything was ok.
With dos.sys and dup.sys, the hard disk boots flawlessly. When I write
Picodos, I get an annoying "boot error".

As I wrote in my previous msg, I created the disk, prepared it with
mydos (option O) and initialized it (option I).

I still don't understand where I'm going wrong, unfortunately.

Thanks,
gianfranco

2.9K? So it's actually an "under 3K" Text Adventure Competition,
rather than "1-2K" - right?

Steve,

Will you be selling and marking down Atari 5200 Multicarts in the future?
$140+ seems a little high, compared to your very reasonable 8-bit carts.

Would be cool if there was a way to program the 5200 carts using a Atari
800!

I might order up a few more 8MBit carts from ya! I already bought 2 1MBit
and 2 8MBits.

Tim

I don't know if it will help, but DDT was also distributed by ANTIC "APX" with
docs on the back of the disk. That might be easier to find. I also recall
that some versions of OSA+ and/or Dos XL had the Bug 65 manual in them.

I don't understand. Is the limit 2KB or 2.9KB? There's quite a
difference.

There is nothing wrong inherrently wrong with the Action manual. It
is a language reference manual, with just a sprinkle of programming
concpets, structured or otherwise. As a reference manual it is short
and to the point. It is not a learn programming book really.

There are errors in the description of interfacing/parameter passing to machine language subroutines. A reference and example with an error. I guess since the parameter passing refers to "How Action! passes parameters" it is wrong for everything, just people don't know it.

The text is terse to the point of being useless in many spots. IIRC something like "You can write stand alone programs if you don't call any routines in the cartridge" which is the text on the topic in its entirety. Great news, but they don't tell you how to do it or give a single example. It is a pointless reference without an example.

Understand that I did learn how to do all this. Problem is I had to learn it by using a debugger on code snippets it produced and tracing crashes.

The reviews are completely subjective, although I'd imagine if others wish
to review the submitted games, they may do so as well.

2K is for the source code, and 2.9K can be the total EXE, BIN, OBJ, PRG,
etc binary file format version of the source code (BASIC, C/C++, Fortran
and Assembly Language).

Sincerely,

Paul Allen Panks

2465. Re: The 1st Annual 1-2K Text Adventure Competition

Newsgroup: comp.sys.atari.8bit
Date: 2004-06-30 02:30:50 UTC
From: Paul Allen Panks <panks@sdf.lonestar.org>
Message-ID: <cbt8ko$e6c$1@chessie.cirr.com>
Source record: 15369
Cross-posted to: rec.arts.int-fiction,rec.games.int-fiction,comp.sys.cbm,comp.sys.atari.8bit,comp.sys.sinclair,comp.sys.apple2

Ammended Competition guidelines are listed below:

Is it possible to write a text adventure in under 2K of RAM? Some people have tried, and some have succeeded.

I would like to officially announce the formation of The 1st Annual 1 to 2K Classic Text Adventure Competition. I will be accepting BASIC, C/C++, Fortran and Assembly language submissions for 1 to 2K text adventures written for the following computing platforms: Commodore 64/128/+4/Vic-20/PET, TI 99/4A, IBM PC/PCJr, Atari 400/800, Apple II/IIe, Sinclair, TRS-80, Color Computer, Acorn, Tomy Tutor, Bally Astrocade, Atari 2600 VCS, DEC Rainbow, Compucolor I/II, Altair 8800, Amstrad, Amiga, Linux, Mac and Windows/DOS.

Please submit your 1 to 2K adventure games to me. The 2K size can be either the source coce, or the EXE, BIN, OBJ, PRG, ELF or other self-contained, self-running binary. So you can thus have, say, a 8K source code listing, so long as the binary format doesn't exceed 2.9KB of size. You may also crunch the binary down with a compressing program such as UPX or Winzip. The competition officially begins on June 28, 2004, and runs through September 29, 2004. I will post all submissions, regardless of when they were submitted, and then review them and post grades on this page on October 7th. Good luck! =)

I will also be accepting user reviews of competition games, which will also be posted on this website.

To help get you started, see my 8KB adventure game, in BASIC, called The Melarkian.

New competition systems: Atari 2600 VCS, DEC Rainbow, Compucolor I/II, and Commodore Amiga.

Updated size requirements: 1-2K for source code, 2.9K for binary format of the same source code game (can be Winzipped or UPXed).

Maximum binary file size should not exceed 2,999 bytes zipped or UPXed. Maximum source code file size should not exceed 2,560 bytes (give or take a few 100 bytes). Absolute maximum is 2,816 bytes for source.

Sincerely,

Paul Allen Panks
dunric@gmail.com

From: secretspam@ihatespam.net
Message-ID: <40e4317c.14567718@news.charter.net>
Source record: 15370

I wasn't aware (or have forgotten) the param passing issues you
mention. I used the manual and made quite a few programs which
functioned, but only in one did I call an ML routine.

Anyway, what I meant about the manual is that it's just a terse
reference manual on the language and not much more. It is okay as a
reference and completely inadequate as a learn how to use it to prgram
type book.

Sorry - may just be me, but I don't understand the limits at all - I can
have 8K
source if it gives a 2.9K exe but the max source code size is 2560?

Also - can I have data external to the executable - read from disc so it
isn't in RAM?

mind you - seeing as I'm using windows and it sticks all sorts in RAM i may
be struggling

This is really strange. You could try the latest development
snapshot of MyPicoDos:
http://www.horus.com/~hias/atari/mypdos40-test3.zip

If this version fails, too, could you please send me your image
by email so that I can analyze what's going wrong? Maybe there's
still a problem in combination with APE or so.

BTW: Which Mydos version did you use? Was there enough room
left on the image for MyPicoDos? Version 3.0 of MyPicoDos
didn't warn you if writing PICODOS.SYS failed (this is fixed
in the new snapshot), maybe that was the problem.

so long,

Hias

Yes, although the total source file cannot exceed 2,816 bytes. THe binayr file, zipped or UPXed, cannot exceed 2,999 bytes. External data files are ok.

As a test, I tried to write a Bally BASIC adventure game today:

```
1 CLEAR;GOSUB200;A=1;PRINT"BALLYVENTURE
2 @(1)=0;@(2)=0;@(3)=0;@(4)=0;@(5)=0;@(6)=0;P=150
3 PRINT;PRINT"YOU ARE:";IF A=1 @(2)=2;PRINT"IN A TAVERN
4 IF A=2 @(1)=1;@(2)=6;@(3)=3;PRINT"BY A WELL
5 IF A=3 @(1)=4;@(4)=2;PRINT"IN A CHURCH
6 IF A=4 @(2)=3;@(3)=5;PRINT"AT THE ALTAR
7 IF A=5 @(4)=4;PRINT"IN STORAGE
8 IF A=6 @(1)=2;@(2)=12;@(3)=7;@(4)=10;PRINT"NEAR A VILLAGE
9 IF A=7 @(5)=8;@(3)=11;@(4)=6;PRINT"BY A TREE
10 IF A=8 @(3)=9;@(6)=7;PRINT"UP THE TREE
11 IF A=9 @(4)=8;PRINT"IN A HUT
12 IF A=10 @(3)=6;PRINT"AT A MOUNTAIN
13 IF A=11 @(2)=13;@(4)=7;PRINT"IN A MEADOW
14 IF A=12 @(1)=6;@(2)=15;PRINT"IN A FOREST
15 IF A=13 @(1)=11;@(3)=14;PRINT"AT A CLEARING

213 PRINT"OK";GOTO 2
```

It almost fits into Bally BASIC, but not quite. Obviously, modifications need to be made for it to work under Bally BASIC's 1,800 bytes of program space.

This shows how much optimization is really necessary. I'd imagine the above program needs at least 50% optimization to fit under Bally BASIC (current 3200 bytes vs. goal of 1600 bytes).

Sincerely,

Paul Allen Panks

Are you sure that these are useful limits? I mean, I'd place all the
test, all the room linkages (doors), possibly even graphics in external
data files. The "source code" would be just a simple text parser, possibly
even with its parsing rules encoded in external files. Maybe you'd even
get a "scott adams" adventure in 2K this way.

So long,
Thomas

So, I write a 1K parser, primative but doable. A 1k database program,
not lookig for miracles just a simple database program. Then I provide a
1 megabyte external datafile which actually contains the adventure?
That's crazy mad.

Source record: 15382

I want to connect a rgb monitor to an Atari 800 XE, but it has not a rgb output and it has not rgb signal anywhere inside. It has (F)BAS and sychro only. There is chroma signal in the computer inside.

I was searching for some schematics of rgb adapter on the Internet but I have not found any.

Does someone know about some? It is not a problem of Atari computer only. I want any adapter which can make rgb from (F)BAS, synchro and chroma. All color TV contain circuit which do it.

My monitor can be set to right frequencies, there is no problem here.

I must remark I have European (!!! PAL !!!) Atari computer version.

tnx

Nonono, what you do is write a Brainfuck interpreter
<http://en.wikipedia.org/wiki/Brainfuck> inside 2K on your platform of
choice, then write a complete Z-Machine implementation in Brainfuck and
supply that as an "external data file". Then write your 1 megabyte
adventure in Inform.

And if you can pull that off, you deserve to win the competition.

It's Sinclair BASIC (really!), and no it's not :-)

It's Sinclair BASIC (http://www.worldofspectrum.org/sinclairbasic/), for
the Sinclair ZX Spectrum (USA: Timex-Sinclair 2068) and no, it isn't
self-modifying.

The most significant "unusual" thing about the BASIC syntax is that,
instead of MID$,LEFT$ and RIGHT$, you would use A$(x TO y), A$(TO x),
or A$(x TO) where x and y are character positions within A$.

I know this is _not_ the kind of suggestion you were expecting, but...
why don't you simply buy an Atari with monitor output?

You can find an 800XL on ebay for around 10 euros, then you build an
rgb cable in 15 minutes and you're ready to go...

ciao

Hi all.

My landlord has finally severed the 20-year emotional bond with his old computer stuff.

The ST 1040 went into the bin and was collected :-O
I'm sorry, I was too late to grab it!
Yes I know, outrageous wasn't it.
I'll can tell you where he works so we can all point at him and sternly frown as he enters and leaves the building! :-)

Awaiting the bin men next Tuesday is a 30 Mbyte hard disk for the ST.
Disk itself has sector errors and the RTC Lithium cell will need replacing, but the rest of it is probably okay.
If you can get hold of a spare SCSI disk and cell, then you're in business.

I was just in time to grab a bin liner full of ST games.
Mint condition boxes and manuals.

Next in line for the crusher is an Atari 800 XL and 1050 disk drive, an Acorn Atom with 64K RAM board, boxes of XL disks, tapes, books etc.

Buy/collect these items now or they die...

Anybody want any of these?

Cambridge UK area - surely there must be plenty of my fellow nostalgic nerds of a certain age round here?

Cheers, K.

PS. I'm still outraged about that ST! I wanted to do some hardware hacks on it, and he new it!
Maybe he wanted it to have a decent burial rather than have it hang around here in pieces?
After all, most guys would want a dead ex-partner buried rather than resurrected Frankenstein style or butchered and hanging around in vats of formaldehyde. If you disagree, please get some therapy...

There is no Atari 8-bit with RGB out. You got composite video, RF and
Chroma-luma (s-video). Some models were missing the Chroma signal at the
monitor jack, and some models didn't have the monitor jack at all.

Scott Adams games actually only need a few dozen bytes of RAM. Most of
the game (16K in the classical games) is ROM.

I've been semi-seriously thinking about an Atari 2600 port of
Adventureland, since we already have the text display engine from
Fellowship of the Ring (which is the _Dark Mage_ engine with
additional enhancements by Thomas Jentzsch, although _Dark Mage_ in turn
borrows from _Stellar Track_). Sure, you'd need a bankswitched cart,
and you'd need a better input scheme than the joystick menus of _Dark
Mage_ and descendents, but I think it might be possible even without
additional RAM. Of course with some of the address space mapped to
additional RAM (like the Supercharger or some later, uh, M-Networks(?)
games) it wouldn't even be that big of a challenge.

The INPUT R$(9) is there to prevent an empty string being INPUTed.
With DIM R$(10,4) Sinclair BASIC defines always an array of 4 bytes
for every array entry, so even if you type nothing in the INPUT the
length of R$(9) will be 4 bytes and making it possible to test the
first left byte of R$(9) by
reading it (i.e LET A$=R$(9,1))

To the best of my knowledge, the QL didn't run Sinclair BASIC, and Sinclair never produced a "ZX". That only really leaves the ZX Spectrum, or the ZX81. The fact that it's a one line multistatement program rules out the ZX81.

>> Well, if you've the source for a good documentation, I'd be grateful.

> What do you want to know about them?

Oh my. Lots and lots of. So, what do we have:

i) There's mapping for additional hardware on the PBPort for the math pack
area. How does that look like?
ii) PBPort allows you to hook in at several places into the Os. At the
hardware level, at SIO level (yes, there's a special SIO replacement) and
at CIO level. There also seems to be some minimalistic SIO/CIO interface
for PBPort. How do I hook into at these levels?
iii) PBPort allows you to mount device handlers besides the traditional
HATABS method. They also allow reservation of user memory. How does that
work, and how do I mount a handler this way?
iv) The XL models seem to use some special SIO commands to mount new handlers
at startup. How are they supposed to work?
v) The CIO seems to be able to mount new devices by itself if it doesn't find
them in HATABS. How does that work?

Ok, enough for now, I would say.

So long,
Thomas

Ya, but how to build an interface for changing chroma/luma to rgb does
nobody know? (I know it is a trivial question for TV developers, but I
need it for an Atari and that is why I ask here).

Remark: I think that all XE/XL models must have a chroma/luma signal at
the GTIA output. If somebody has an Atari without monitor output jack or
there is some signal missing on it, it must be possible to connect the
jack or the signal.

The QL ran something called QDOS, which was essentially BASIC. But
one way it differed from the ZX and Spectrum series was
that the BASIC keywords were manually typed instead of entered
by single-strokes (on the ZX and Spectrums).

I don't recall which of the BASICS (if any or all) allowed
multiple statement lines. I'd have to dig out my manuals
but I agree that it probably rules out the ZX80/81 series.

As was mentioned earlier, the QL didn't run Sinclair BASIC - it ran Superbasic.
However, having not used Superbasic, I can't say if this particular program will
run on the QL. I *do* know the author though, and can quite categorically state
that he wrote it on a ZX Spectrum.

CODE() is pretty-much the Sinclair BASIC equivalent of ASC(). It returns
the numeric character code of the first character in the supplied string
parameter. For the most part, the values returned coincide with ASCII
for characters in the range 0 to 127, the ZX Spectrum has it's own
peculiar set of extended characters in the range the 128 to 255.

And yes, those are references to previously-defined variables in the
DATA statement.

It's a clever bit of work by Mr.Koelman and no mistake!

As far as I know these are the models that have chroma-luma available at
the monitor connector:

800
some late model 800XLs
XE series (some European 65XEs, 130XEs, 800XEs)

Most of the XLs either didn't have chroma connected at the montior jack (an
easy fix with a resistor and length of wire), or didn't have a monitor jack
at all (North American 600XLs). The XEGS didn't have a monitor jack, but
had two RCA jacks for composite video + audio.

Actually 2,814 bytes, small enough to fit into an unexpanded Vic-20.

For the Vic/64:

A few changes need to be made (it was written under QBasic), including
removing the RANDOMIZE TIMER statement in line 52. CLS should also be
changed to PRINT CHR$(147).

For other computers:

CLEAR or CLS for clearing the screen, and perhaps some changes to the RND
functions. But with a few modifications it should work under most BASICs.

It 's no typo. It is data. On 1 screen you get the text
You see A BOOK ABOUT TIMETRAVEL
and on an other screen you get the text
you see A TIMETRAVELMACHINE.

You could change the data to A BOOK ABOUT TIMETRAVELMACHINE
and make the sentence YOU SEE A as standard and point to A BOOK ABOUT
TIMETRAVEL on the first screen and to TIMETRAVELMACHINE on the second
screen, but you would only gain app. 10 bytes.
(BTW in the dutch version the data is optimized and more text added)
(It should be placed at the dutch HCC-Sinclair webpages, but still not
there...)

Ahh, that explains why (in an earlier post) I thought it might have been
self-modifying code. By the standards of most BASIC interpreters, it *IS*
self-modifying!

:-)

The QL's SuperBasic was sort of an enhanced Basic with several new features.
SuperBasic did not require line numbers but it would accept them. It also
allowed calling subroutines and other 'objects' by name instead of line number.
It had a LOT of new features which I can't recall now.

I had a ZX-81, a Spectrum, and two QLs. I retyped several of my ZX and
Spectrum Basic programs into the QL and they would usually run, except for
graphics.

>I *do* know the author though, and can quite categorically state

Same difference. Basically (NPI), SuperBASIC is Sinclair Basic on
steroids. All the statements in the program in question are in
SuperBASIC; from reading the manual it _seems_ that they should all work
in exactly the same way as on the Speccy, but I can't be sure until I
find the beast itself and get it working.

> > However, having not used Superbasic, I can't say if this particular program will
> > run on the QL.
>
> The QL's SuperBasic was sort of an enhanced Basic with several new features.
> SuperBasic did not require line numbers but it would accept them.

A SuperBASIC program consists of a sequence of SuperBASIC
/statements/, where each statement is preceded by a /line number/.

That's a direct quote from the QL manual, "Concepts", page 39.

Just as on the Spectrum, a line entered without a number was processed
as a direct command.

> allowed calling subroutines and other 'objects' by name instead of line number.

So did the Spectrum; the way both the QL and the Spectrum handle this is
by making the parameter of GOTO and GOSUB an expression rather than a
constant line number. All you have to do is LET takeroutine=2000, and
then you could GOSUB takeroutine.
What the QL also had, however, and what you're probably thinking of, was
defined functions and procedures, with parameters. That wasn't available
on the Spectrum.

> It had a LOT of new features which I can't recall now.

Two output channels, extended graphics, (somewhat) better sound,
built-in network and microdrives reachable from Basic, direct machine
code calls _with_ parameters, proper looping and selection statements,
automatic data type coercion (which can be both a blessing and a curse),
"natural" string comparison, and quite a bit more.

> >I *do* know the author though, and can quite categorically state
> > that he wrote it on a ZX Spectrum.
>

> You should have said this in the first place.

With hindsight, it was obvious from the formatting. It looks exactly as it does when you type it into a Speccy.

Richard

2528. Re: Atari 800 Boot Sequence

Newsgroup: comp.sys.atari.8bit
Date: 2004-07-02 15:14:25 UTC
From: Konrad Kokoszkiewicz <draco@obta.uw.edu.pl>
Message-ID: <cc40uc$h5j$1@nemesis.news.tpi.pl>
Source record: 15285

First, in fact there are two separate things there:

1) "minimalistic" routines that allow a "normal" (SIO or CIO type) OS device to be initialized and work.

2) routines that handle some quite complicated device, which loads own system elements; these are able to (less or more) dynamically handle it.

I have an impression, that the second stuff has been prepared for some sophisticated expansion card, that never came out. In our circumstances all this is really useless, because such a device (as far as I call tell) cannot coexist with normal DOS, contrary the device must provide all the DOS routines in a way, that is not completely clear for me at the moment.

However, this doesn't render useless the devices and routines dedicated to the first type mentioned (standard SIO and CIO).

> i) There's mapping for additional hardware on the PBPort for the math
> pack area. How does that look like?

$D803 - PDVMARK1 - fixed value $80
$D805 - PDIOR - an entry point to the main PIO routine (block I/O level, i.e. SIO), that f.e. reads or writes a sector on the harddisk etc.
$D808 - PDVINIT - an entry point to the main PIO initialization routine, called at reset (both warm and cold).
$D80b - PDVMARK2 - fixed value $91

Values that apply for the character device level:

$D80d - PDVOPV - CIO OPEN vector for the device
$D80f - PDVCLV - CIO CLOSE vector
$D811 - PDVGBV - CIO GET BYTE vector
$D813 - PDVPBV - CIO PUT BYTE vector
$D815 - PDVSTV - CIO STATUS vector
$D817 - PDVSPV - CIO SPECIAL vector

Obviously, when you're preparing a block device (e.g. a hard drive), you don't define CIO vectors.

Honestly, I cannot tell you more about initialization ATM, because I am now unable to find the appropriate book, that contains the RESET routine listing (and specifically, DEVINIT). The book should be somewhere here, but I cannot find it.

> ii) PBPort allows you to hook in at several places into the Os. At the
> hardware level, at SIO level (yes, there's a special SIO replacement)
> and
> at CIO level. There also seems to be some minimalistic SIO/CIO

> interface
> for PBPort. How do I hook into at these levels?

There are two hardware registers predefined for the PBI devices:

$D1FF - PDVINT - read only - PBI device interrupt mask. If a PBI device requests an IRQ, it should clear its (definition for "its" below) bit in this register. The bit should be automatically reset once the OS interrupt service routines read the register.

PDVINT is optional, if a device does not generate interrupts, the OS will not care.

$D1FF - PDVREG - write only - PBI device register. This register enables and disables the devices.

Only one bit of this register can be set at a time. This means, that there can be up to 8 separate SIO/CIO devices attached to the bus.

When a bit is set, the corresponding device should disable the math-pack, and enable own ROM in this area AND its specific hardware registers on area $D100-$D1FE ($D1FF is reserved, see above).

The device shold not rely on the particular PDVREG bit, that it is attached to. The bits should be assigned in the order the devices are attached, i.e. if you have a PBI floppy only, it should get bit 0, if you have PBI hard drive only, it should get the bit 0, but if you connect both, one of the devices should get bit 1 and it must still work.

> iii) PBPort allows you to mount device handlers besides the
> traditional HATABS method. They also allow reservation of user
> memory. How does that work, and how do I mount a handler this way?

I don't see any possibility of reserving user memory here. The routines just provide some way to load position independent code, that is stored at the address pointed to by MEMLO, and then MEMLO is raised.

> iv) The XL models seem to use some special SIO commands to mount new
> handlers at startup. How are they supposed to work?

This command is for the aforementioned card and is of no use with current devices.

> v) The CIO seems to be able to mount new devices by itself if it
> doesn't find them in HATABS. How does that work?

I can tell you as much as you probably guess: when the CIO does not find the HATABS entry, it calls the same rotine, that is called at startup, and is supposed to load system components (device drivers) from the PBI bus.

The loading is done with specially defined SIO/PIO command issued to the PBI bus.

The device is supposed to answer and actually provide a (position independent) code of a driver, and then the OS initializes it.

This actually means, that you can attach new devices at runtime and there is no need to reset the machine to get the device initialized. However, notice that it only applies to the character devices (CIO), and not to the block devices (SIO). Block devices are only initialized at startup.

However, I must say, that this is useless with current software, and especially with current DOS and binary file format, which is not relocatable. In the situation, when this is the program, that decides where to load itself, and not the OS, where to load the program, any memory allocation techniques make no sense.

The XL OS designers made marvellous work, this is a trurly professional 8-bit OS. However, most of this effort has been wasted by introducing a very primitive DOS and the $FFFF exec files.

The program as posted here should load straight into BASin - you can get that at

http://homepage.ntlworld.com/paul.dunn4/BASin_r10a.exe [1]

BASin is something else - it's kind of an emulator, and kind of an IDE for Sinclair BASIC (48k, no sound atm, very much a work in progress) with the nice things you get from modern programming suites, such as debugging tools and code helpers etc. The program is probably easy enough to enter into an emulator [2][3] but BASin makes code entry trivial due to the non-keyword layout of the keyboard... And I'd recommend BASin anyway :-) [3]

I think I've blown my own trumpet enough now[4].

D.

[1] Plug Tax in the post.
[2] I'd recommend SPIN, of course[1]
[3] Mostly cos I wrote it.

Huh? What do you mean with that? The original Scott Adams games which I ran on my original TRS-80 Model I required 16KB of RAM. Are you perhaps talking about game cartridges for the CoCo? The games originally came on tape. The interpreter itself takes only couple of KB, the databases normally are about 12KB lare.

> $D80b - PDVMARK2 - fixed value $91

In fact, the $D808 contains a jump to the PDVINT, i.e. to the PBI interrupt service routine. The real address of the initialization routine (PDVINIT) is $D819.

>self-modifying!

No, it is not. I made *very* sure to check this point.

The data is read ONCE and never modified. Using variables in the
DATA statements just allows the program source to take less space.
The RESTORE statement is not needed (unless there is a peculiarity in
that BASIC requiring it). The line number is wrong for the RESTORE.

The initialisation of P is not needed either.

The T FOR loop would have been better implemented as a WHILE or
equivalent.

The key to understanding the program is that T is modified by
only one iteration of X and that R$ contains a set of *offsets* for
determining the next state/room. The next state is the current one
plus the ASCII value of the appropriate R$ character minus 47. When
this exceeds eight, the T FOR loop is exited, and the game is over
(win or loss).

Sincerely,

Gene Wirchenko

Howdy folks

I've found a nice tft monitor that I am considering to buy (Joytech 7 inch TFT). But my question is:

Can I hook two monitors to an Atari computer at the same time?
Maybe via a powered splitter?

That way, I could use one monitor for my self and the other (joytech) for the visitors if I want to demonstrate software at a fair.

From: Music Shop Landgraaf <landgraaf.musicshop@hccnet.nl>
Message-ID: <40e5d180$0$147$3a628fcd@reader2.nntp.hccnet.nl>
Source record: 15293

Howdy folks

A couple of years ago, I put the mech of my second XF551 (bad connector blues on the PCB) into my mini tower and hooked it up to my BlackBox and FloppyBoard. It worked fine up till a month or two ago. It doesn't seem to be able to read any data from a floppy. I have verified that the floppy is good and have used disk head cleaner fluid in the heads. No change. I've also used the TaskMaster (sector editor inside the BlackBox/Floppyboard) to read sector 720 (to see if the problem was in the first sectors only or in all). It can't read that one either.

I do have a multimeter, but don't have (the knowledge to use) a scope.

What can I do to correctly diagnose the mech?

CU Mathy van Nisselroy

2541. Adventure Competition Update

Newsgroup: comp.sys.atari.8bit
Date: 2004-07-02 22:25:38 UTC
From: Paul Allen Panks <panks@sdf.lonestar.org>
Message-ID: <cc4nd2hlr1@chessie.cirr.com>
Source record: 15234
Cross-posted to: rec.arts.int-fiction,alt.lang.basic,comp.lang.basic.misc,comp.sys.cbm,comp.sys.sinclair,comp.sys.tandy,comp.sys.apple2,comp.sys.atari.8bit,alt.lang.asm

Three days into the "1 to 2K Classic Text Adventure Competition", we have 3 entries submitted (1 of them mine, of course). The competition website can be found below.

==========
The 1 to 2k Classic Text Adventure Competition
==========

http://panks.freeshell.org/advcomp.html

==========
From my website
==========

"Is it possible to write a text adventure in under 2K of RAM? Some people have tried, and some have succeeded."

I would like to officially announce the formation of The 1st Annual 1 to 2K Classic Text Adventure Competition. I will be accepting BASIC, C/C++, Fortran, Assembly language, and TADS submissions for 1 to 2K text adventures written for the following computing platforms:

Commodore 64/128/+4/Vic-20/PET
Texas Instruments 99/4A
IBM PC/PCJr
Atari 400/800
Apple II/IIe
Sinclair ZX80/ZX81/Spectrum/128/QL/+
TRS-80 I/II/III
Color Computer 1/2/3
Acorn
Tomy Tutor
Bally Astrocade
Atari 2600 VCS
DEC Rainbow
Compucolor I/II
Altair 8800
Amstrad CPC/464
Commodore Amiga
Linux
Macintosh (including Classic Mac)
Windows/DOS.

Please submit your 1 to 2K adventure games to me. The 2K size can be either the source code, or the EXE, BIN, OBJ, PRG, ELF or other self-contained, self-running binary. So you can thus have, say, an 8K source code listing, so long as the binary format doesn't exceed 2.9KB of size.

You may also crunch the binary down with a compressing program such as UPX or Winzip. The competition officially begins on June 28, 2004, and runs through September 29, 2004. I will post all submissions, regardless of when they were submitted, and then review them and post grades on my page on October 7th. Good luck! =)

==========
The "Rules Are Guidelines"
==========

Maximum binary file size should not exceed 2,999 bytes zipped or UPXed. Maximum source code file size should not exceed 2,560 bytes (give or take a few 100 bytes). Absolute maximum is 2,816 bytes for source.

I will also be accepting user reviews of competition games, which will also be posted on this website.

==========
Some general tips to help you get started
==========

Dark Mage (4K) fit into the limited memory of the Atari 2600 VCS. There are also the 2K Adventures by Fredrik Ramsberg and Johan Berntsson, providing a good basis for how to fit a text adventure into under 2K of RAM. And if Bally Astrocade owners need inspiration, check out Cavern Quest by Bruce Jaeger.

Certain programming languages, such as Bally BASIC and Spectravision Compumate (Atari 2600 BASIC) require special considerations for lack of string variables. Other integer-based BASICs, such as Palo Alto Tiny BASIC, require even more consideration when writing text adventures. It is possible, however, to write text adventures using integer-based BASICs with creative use of simple menus (and even joysticks, in the case of the Atari 2600's Dark Mage and Bally BASIC's Cavern Quest) to simulate traditional verb/noun user input.

Another consideration when writing: Does your system use/need RAM expansion? If so, in the case of the Sinclair ZX80/ZX81 or Commodore Vic-20, what changes need to be made to the game's source code? Also ask the question of which language is best suited for the memory limitations of your machine? Will Assembly Language do a better job, in more efficient code? Or will C/C++, Fortran or BASIC do the job just as well?

Finally, when starting on a new adventure game, ask yourself what 2K can achieve, and what modifications need to be made for the proposed game to work under the aforementioned RAM. In the case of Bally BASIC, there are exactly 1,760 bytes of RAM available. Is that enough to write your game? If not,

should Z80 assembly language work better for your Bally adventure game? How about on the Apple? Do you choose integer BASIC, Applesoft BASIC, C/C++, Fortran or assembly language? What will do the best job for the game you intend to author? These questions all should be asked before sitting down to write the first line of code for your adventure game.

=========
Story Ideas
=========

Need an idea for an adventure game? Look around your environment. Or choose from popular culture, especially movies, folk stories and books. Is the old "castle beyond the forest" still cool enough to build a game around? How about humorous stories, such as the search for the Golden Cat? Does the Golden Cat meow? Is it a prized artifact from a lost civilization? Only you can decide such a story! A good, basic storyline need not be complicated, either. You might place the player in a spaceship or on Jupiter. How about sending the player out of the Solar System in search of the meaning of life? Or how about a game centered into the human brain, like a synapse moving about the neural pathways within the visual cortex?

Perhaps you could also write events in the past, such as the Alamo, Tombstone or Gettysburgh (to name a few). Another game scenerio could be the player entering a "tunnel of light" after eating too much at Denny's (sort of like a mysticism event, like an Out-of-Body-Experience). And then there are also the stories about ghosts moving through walls, animal spirits roaming a lone hillside (such as the Nordic Wolves) and other strange things such as The Mothman and Big Foot. The potential storylines are very interesting, to say the least!

To help get you started, see my 8KB adventure game, in BASIC, called The Melarkian:

http://panks.freeshell.org/melark.zip

There is also "B-Venture", my own competition game submission, listed below:

http://panks.freeshell.org/bvent.zip

Sincerely,

Paul Allen Panks

That's what I mean: the actual volatile data in the game is very, very
small (look at Alan Cox's "ScottFree" interpreter, for instance).

In a design where you can map new ROM into the memory map--by a
cartridge, most commonly, then you only need a very small amount of RAM
to play the game. Obviously if you're loading the game from tape or
disk, you need somewhere for the nonvolatile data to go as well.

Adam

The part that needs to be changeable is very little. Most is the
interpreter and the data tables. These do not change.

Most laser printers do not use Epson control codes and would probably be
hard to get to work on an Atari. Most lasers use HP or Postscript.

You should be able to use an epson inkjet.

> "artistic" treatment?

Depends on the beholder's eye.
Judging from recent exhibits, one could put Damien Hurst on an unmade bed,
ram an old computer up his output port, chainsaw the lot into slices, and
give it a title like "Artist auto-sodomised by his own art".

If you're Tracy Emin, you might get 50 grand.

Most other people would get life without parole in a psychiatric hospital...
```

Have you tried to format a blank floppy with drive and do read/write tests
with that disk. If it works, you're most likely looking at an alignment or
spindle speed problem. If it doesn't work, then I usually try the drive on
another system/controller.

Well, this idiot has probably convinced just about everyone here not to buy from him... but since he has decided to keep annoying the newsgroup, I am ready to take things a step further.

Anyone know of some good links for reporting this sort of pirate copyright infringement activity? I'm not talking about FBI or local law enforcement, I'm talking about someone who will send a nice cease and desist letter and also potentially sue him for all of his profits. I really want to see this guy get the attention that he keeps asking for...

Suggestions? :-)

> Has anybody ever tried to get a laserprinter (possibly one that does color)
to work with our beloved Atari 8 bit computer? <

This gets more difficult each year. I've done an extensive search for *new*
lasers that will work with the A8 and found *none*. It is now almost
impossible to even find one that will work with MS-Dos.
If you check back to lasers and Ink Jets manufactured in the early to mid
90's, you should find some that work with the A8. Lots has been written on
this subject -- check csa8 Google Groups archive.

But if you have access to W95/98/ME (and probably not XP) you can use APE quite
effectively to print with most any WinPrinter.

Another possibility is DosPrinter. Check out this link:
http://www.dsbglobal.com/dosprinter/

DosPrinter really works well! The one thing that would make it better is if
APE would add a CR/LF converter to the "PC-Mirror" facility.

Short of all that, get out the "rubber gloves" and keep on refilling those ink
cartridges! ;-)

Well, I'm sure the usual auction sites don't take kindly to pirate
multicarts, so they won't be moving too hot on ebay. I dunno about that
"Bidiots" site tho. I'd be surprised if they allow pirate materials to
be sold on their site. (Speaking of Bidiots, who the hell would give
their web site such a condescending name?)

Activision prolly wouldn't like him selling some of those games on
there, and I know one or two of the ROMs on the cart were pulled due to
the copyright holders complaining.

Looking at his auction it appears he finally sold it, so I doubt he will
be back.

Hi. Some Laser printers speak Epson or maybe IBM proprinter, but the
print will not look as good usually as when a driver for the printers
true capabilities are used. Not sure about HP. I think some Okidata
lasers (LED actually) might be usable. I have an Okidata 10EX and it
has emulation modes and a parallel port.

> Ya, but how to build an interface for changing chroma/luma to rgb does
> nobody know? (I know it is a trivial question for TV developers, but I
> need it for an Atari and that is why I ask here).

Every colour TV has such a circuit inside!

The tuner extracts composite video off the RF tuner,
then splits it into luma and chroma (i.e. S-video),
then converts those into RGB to drive the colour guns.

Most decent TVs have S-video input and RGB,
cheaper TVs just have S-video.

I've never seen one with RGB input only, which would be the only situation
for duplicating the circuit.

Don't bother trying to send the RGB to a VGA monitor, these are unlikely to
be able to synchronise to TV frame rates.

> Remark: I think that all XE/XL models must have a chroma/luma signal at
> the GTIA output.

Yes they do. Atari forgot to connect chroma to the monitor socket in many XL
machines and didn't fix it until late versions.
Few monitors or TVs had luma/chroma input at the time, so it wasn't a
disaster.

> If somebody has an Atari without monitor output jack or
> there is some signal missing on it, it must be possible to connect the
> jack or the signal.

Yes, this is well documented on the web.
One wire, two solder joints, done.

I'm sure you asked these questions ages ago, and I said the same answers.

I made a simple cable to connect the Atari 800XL monitor socket to an
s-video socket and two phono sockets.
This drove my TV and hi-fi without problems, and you can improve the piccy
by tweaking the video circuit.
See http://www.howell1964.freeserve.co.uk/Atari/800XL/Atari_800XL_Video.htm

Well, there was that American criminal who agreed that his executed body
could be frozen, sliced into 1mm thick sections and scanned for the 'visible
human' project.

Would a Damien Hurst salami pickle be a case of art imitating life (or more
correctly, death)?

Apparently the yanks had to wait a long time for the right subject.
They should have just advertised on a German cannibalism fetish site,
under the frozen food section.

2561. Porting game question?

Newsgroup: comp.sys.atari.8bit
Date: 2004-07-04 09:13:31 UTC
From: Paul Allen Panks <panks@sdf.lonestar.org>
Message-ID: <cc8hnr$6kc$2@chessie.cirr.com>
Source record: 15316

I am interested in porting B-Venture, a text adventure I wrote, to
the following classic systems:

Atari 2600 VCS
Atari 400/800
Apple II/IIe
Sinclair ZX80/81/Spectrum
Tandy Color Computer 1/2/3
Texas Instruments 99/4A
TRS-80 1/2/3

The version, as currently written, works on Windows/MSDOS and the
Commodore 64/128 and unexpanded Vic-20.

See:

http://panks.freeshell.org/bvent.html

Sincerely,

Paul Allen Panks

[Headers set to comp.sys.atari.8bit]

You are not doing yourself any good with the attitude. While I don't
really think that $135 is to bad for the cart. I would never buy from
you because of the attitude shown here. You should just have ignored him.

Hi Konrad,

> 1) "minimalistic" routines that allow a "normal" (SIO or CIO type) OS device
> to be initialized and work.

"normal" in the sense as it uses the regular CIO/SIO interface, yes. Not
normal in the sense that it doesn't get into the system by attachment to
the SIO chain, I suppose.

> 2) routines that handle some quite complicated device, which loads own
> system elements; these are able to (less or more) dynamically handle it.

> I have an impression, that the second stuff has been prepared for some
> sophisticated expansion card, that never came out. In our circumstances all

> i.e. SIO), that f.e. reads or writes a sector on the harddisk etc.
> $D808 - PDVINIT - an entry point to the main PIO initialization routine,
> called at reset (both warm and cold).
> $D80b - PDVMARK2 - fixed value $91

The device is required to map its ROM into the Math pack area by pulling
the math pack disable line of the MMU. But on the reaction of what? I mean,
this mapping isn't permanently, so something has to trigger the device to
make its ROM appear there.

> Values that apply for the character device level:

> $D80d - PDVOPV - CIO OPEN vector for the device
> $D80f - PDVCLV - CIO CLOSE vector
> $D811 - PDVGBV - CIO GET BYTE vector
> $D813 - PDVPBV - CIO PUT BYTE vector
> $D815 - PDVSTV - CIO STATUS vector
> $D817 - PDVSPV - CIO SPECIAL vector

> Obviously, when you're preparing a block device (e.g. a hard drive), you
> don't define CIO vectors.

How does the Os decide whether this is a SIO or a CIO device?

> Honestly, I cannot tell you more about initialization ATM, because I am now
> unable to find the appropriate book, that contains the RESET routine listing
> (and specifically, DEVINIT). The book should be somewhere here, but I cannot
> find it.

Well, I've two books about that kind of nonsense, one is the "Atari Profibuch"
which approximately lists the same ROM interface as given above, but does not
describe how and when this mapping has to be activated. The second is the
"Atari Intern" by Data Becker, though this book is full of errors (obvious
and less obvious) and - as far as I believe - came to existence because the
authors disassembled the Os and tried to understand how it works (quite
unsuccessful in certain areas, though). In other words, I don't have any kind
of "official" document (e.g. "De Re Atari") for that stuff, and what I have
is highly inaccurate and unprecise.

>> ii) PBPort allows you to hook in at several places into the Os. At the
>> hardware level, at SIO level (yes, there's a special SIO replacement)
>> and

> disables the devices.

> Only one bit of this register can be set at a time. This means, that there
> can be up to 8 separate SIO/CIO devices attached to the bus.

Does this also select the ROM mapping, or is this just the mapping of
the device into the IO-slot (i.e. the D1xx area?)

> When a bit is set, the corresponding device should disable the math-pack,
> and enable own ROM in this area AND its specific hardware registers on area
> $D100-$D1FE ($D1FF is reserved, see above).

Ah, I see.

> The device shold not rely on the particular PDVREG bit, that it is attached

> if you have a PBI floppy only, it should get bit 0, if you have PBI hard

> drive only, it should get the bit 0, but if you connect both, one of the
> devices should get bit 1 and it must still work.

Ok. When does this get activated? On bootstrap by SIO? How does SIO
decide whether or not to talk to a "parallel" device?

>> iii) PBPort allows you to mount device handlers besides the
>> traditional HATABS method. They also allow reservation of user
>> memory. How does that work, and how do I mount a handler this way?

> I don't see any possibility of reserving user memory here. The routines just

I see. So how does that work?

>> iv) The XL models seem to use some special SIO commands to mount new
>> handlers at startup. How are they supposed to work?

> This command is for the aforementioned card and is of no use with current
> devices.

Hmm. I see.

>> v) The CIO seems to be able to mount new devices by itself if it

> relocatable.

In other words, not even smart extensions as "The Black Box" makes use
of this. What does it make use of? Just the "block device" interface,
aka "SIO"?

> In the situation, when this is the program, that decides where
> to load itself, and not the OS, where to load the program, any memory

> primitive DOS and the $FFFF exec files.

"Wasted" is a nice word. I've been able to tweak a file management system
and a DUP command line into these "unnecessary" parts of the Os...

So long,
Thomas

2565. atari++ 1.36 ready

Newsgroup: comp.sys.atari.8bit
Date: 2004-07-05 09:30:57 UTC

Source record: 15320

Hi,

and another release of the Atari++ emulator for windows and Linux
is ready for download at its usual URL:

http://www.math.tu-berlin.de/~thor/atari++/

This time, we're going for the 1.36. Basically, two important features
have been added. For one thing, emulation quality should have improved
quite noticably since I fixed two noteworthy bugs in the Antic emulation
concerning the timing. This means that, for example the "Numen" demo
will work fine now. Make sure that you select "XE" as emulated machine
and pick "4" as the number of "XE memory banks" in the MMU emulation
since the emulator threads memory expansions that go into the 0x4000
area as "XE type RAM banks".

Second, I implemented a native DirectX sound interface for the win32
platform. The SDL sound output utilized in previous releases had a
major latency problem not allowing game play and sound in sync, fixed
by the new sound frontend. For linux, this has never been a problem,
though, ALSA is the front-end of your choice.

Thus, happy gaming for all of you. I'm awaiting a couple of new ideas
for the next release then... (-;

So long,
Thomas

I don't quite understand what do you mean by "SIO chain" :-)

> The device is required to map its ROM into the Math pack area by
> pulling

On reaction to set the corresponding bit of PDVREG ($D1FF).

>> Values that apply for the character device level:
>
>> $D80d - PDVOPV - CIO OPEN vector for the device

>
> How does the Os decide whether this is a SIO or a CIO device?

This is not the OS that decides, this is the device (via PDVINIT $D819,
called at every reset).

> Well, I've two books about that kind of nonsense,

Well, my books are apparently better. This is the OS listing with extensive
commentary, four books published in 1988-1989. These books have been proven
reliable since, errors are rare and easy to fix/verify (e.g. there are few
mistakes in the listing itself, like a label one line up or down to the real
position etc.).

I've successfully developed an IDE disk driver basing on these.

>> The device shold not rely on the particular PDVREG bit, that it is
>> attached to. The bits should be assigned in the order the devices
>> are attached, i.e. if you have a PBI floppy only, it should get bit

>> you connect both, one of the devices should get bit 1 and it must
```

>> still work.
>
> Ok. When does this get activated?

When WHAT does get activated?

Bits in the PDVREG are assigned in hardware, so this "gets activated" on power-up. The software intialization is performed at OS startup (a call to $d819 at every reset). Then the bitmap representing successfully initialized devices is recorded for later use by SIO. The SIO, on every call (like "read sector"), examines this bitmap and tries to activate PIO devices first. Once activated, it gives the control out to the PDIOR ($d805). The PDIOR routine decides (basing on contents of the DCB), whether the call is intended for a PIO device or not. Two possible results:

1) If so, it handles it, and returns the status to SIO, which completes then.

2) If not, it signalizes it to the SIO, and the SIO does further attempts to activate subsequent PIO devices. When this completely fails, it falls back to the serial bus devices.

>> I don't see any possibility of reserving user memory here. The
>> routines just provide some way to load position independent code,
>> that is stored at the address pointed to by MEMLO, and then MEMLO is
>> raised.
>
> I see. So how does that work?

It sends the following command to the SIO/PIO bus:

$4f,$01,$40,$40,$ea,$02,$1e,$00,$04,$00

It looks like a DCB command for an RS-232 device. When the device responds positively, the OS receives some data (it is rather difficult to know, what data, because the command $40 is unknown otherwise), and then jumps via RUNADR.

Notice however, that this procedure isn't actually linked with PIO. A SIO device can be handled such way to, if it knows to respond. So the only routines strictly connected with PIO are these you call "minimalistic".

> In other words, not even smart extensions as "The Black Box" makes use
> of this. What does it make use of? Just the "block device" interface,
> aka "SIO"?

I suspect so. The "SIO" (in fact, PIO) is completely sufficient to handle a device like hard drive, RS-232 ports etc. At this level, that is.

> "Wasted" is a nice word. I've been able to tweak a file management
> system and a DUP command line into these "unnecessary" parts of the Os...

I don't doubt that you were "able" to do that, but you do not expect my applause for that, do you? :-)

I'd bet the SIO cable connector broke loose from the circuit board. You
can try to resolder it, but it is like trying to solder tin foil on a
cracker.

The Sinclair Spectrum is truly a masterpiece, a gift of the god Clive Sinclair to mankind, the truly most advanced computer ever created by skilled English developers who are much more intelligent than Americans.

But there are heretics who don't accept the godlike status of the Sinclair Spectrum and use crap like the C64 or the ATARI 800.

Both these computers are utter crap and nothing compared to the godlike Spectrum !

Spectrum = King of computers, C64 and ATARI 800 = court jesters !

In the USA, the only Sinclair computer that had any impact was called
the Timex Sinclair 1000 or something like that. It was little black
box with a flat keyboard and 16k of memory or something like that. It
was a horrible computer. One thing about it, it was cheap as hell,so
it helped alot of people get a computer who could not afford a
commodore 64, Atari 800, Apple IIe etc.. Aside from that I see
nothing so great about it.

Personally I prefer the Atari 8-bits (and started out on a Atari 400)
but looking back all the 8bit machines had their own charm and people
tend to think of the platform they used as kids as the one that was
head and shoulders above the others... when in reality the Atari ruled
LOL

>I'd bet the SIO cable connector broke loose from the circuit board... <

I've been fortunate and successsfully repaired a couple of these. (And I've also tossed a couple out!) If you have a 551 without rivets or machine screws holding the SIO jacks to the circuit board, then you'll definitely want to get some very small machine screws/nuts/washers and get those jacks clamped down. I like stainless steel. (I've also seen loose (Atari) rivets that didn't do squat.)

Have you tried a different cable and a different drive to rule out other parts? You might get lucky...

The SIO traces are *tiny* and close together, but they can be repaired. I've had the best luck using very small gage teflon sheathed jumper wire. I find a magnifying glass and a very small soldering tip are definitely helpful. I study the traces with good magnification and light and check point to point with a DVM/VOM. Good Luck!

It had 2 kb RAM. With the RAM pak that pluged into the expansion slot it had
16 kb RAM.

> It was a horrible computer.

I soon replaced mine with a real computer, a Commodore.

> One thing about it, it was cheap as hell

I paid $19.95 (US) for mine when K-Mart had them at a closeout price. Had to
pay twice that much for the RAM expansion pack when I found it was almost
useless with just the built-in RAM. The 32 column printer that was available
for it was a joke also.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

In the era of PC's with 64bit and up processors I guess all home computer users should unite. Besides that I'm using the atari 8bit computers since 1984 and I think exactly the same about my atari 8bit as you do about your Sinclair Spectrum. It's like having a child: you are always more proud at your own child.

I guess many homecomputers have their own good and bad things. When I'm honest I would love to have the sound chip of the commodore 64 in our atari 8bit computers, but then again the expand-possibilities of the atari 8bit are far better and the i/o ports are much faster too. It is very nice to see the atari 800xl and commodore 64 are both extremely powerful machines. There were the differences are the smallest, the fights between people are the biggest. And that's why atari users and commodore users hardly can't agree.

In the past I have used an Apple //c for serious stuff. I have to admit this 6502 based machine was much better for serious stuff as my atari 8bit computer is. Apple Works did a very good job. But for games i found it terrible.

In my opinion (and that is personal) the C64 and atari 800xl are the best 8bit homecomputers ever made and so they are sharing the FIRST PLACE. All others are far below.

I wish you very much luck with your Spectrum. It is not bad... but definately NOT the king :-) I'm sorry.

Marius.

I remember thinking they had a lot of nerve calling those things
"computers." One of my unfortunate friends had one so I tried to program
some things on it. What a joke.

I agree with Marius... all old computers (like 8 bit ones) are cool in their
own way... So i kinda 'embrace' and welcome a new old computer stuff i
get... [OT] Example: i just recently got a 'complete' mac system (macintosh
1k) with a harddrive (which is what i was wanting for my macs for a good
long while). [/OT] I know that may sound like blastphemy... but i like old
computers and am not limited to just one.

Even though the ZX81 family of computers, which the TS1000 is a part
predates the Spectrum, it is still better than C=64, as of course are the
Spectrum, SAM Coupe and other Sinclair (and related) computers are.

The fact you all bought the TS1000, shows how popular it was. The TS1000
can use normal printers to, and if the ZX printer was so bad why was
an interface made so that the C64 could use it. On sunday I gave my local
computer club a crossword, one of the clues involved the C64 most members
had not heard of it. Instead of getting the C64 you should have upgraded to
a TS1500 (like the TS1000 but better) or TS2068 (a speccy clone).

Yeah, that king spent all his days waiting tapes to load, eating goat meat at the time, so at the end he got ill by the king's disease (also called gout, podagra), making his movement hard and painful, got replaced and died in oblivion.

My 8-bit ages were mostly spent with Apple IIc (clone), which although bad for gaming was ok for computer work at the time. Yeah, it was lacking the turboloaders like JiffyDOS or ProLOGIC, but it still loaded fast and the disk writes were reliable. Not to mention the hundreds of serious aplications, the 3 free slots (I even had Z80 board for CPM, and the modem for calling local BBS).

IMHO the C64 is the best 8-bit computer (still), but look at the calendar - it's 2004th year, and this discussion is 15 years obsolete now. I think you will get better response to your bait, if you post something about PS2 vs XBOX vs GameCube for example, but then again who of these gamers read newsgroups. Next time look somewhere else, please.

P.S. The biggest 8-bit maniac I've ever seen had a whole library (taking one wall in his flat), filled with Sinclair tapes {coppied}). I don't even want to think how much time it took him to write and errorcheck all this tapes, but he was proud that he had so many titles.

I think you are full of shit, no wander the sewers are empty.

The ZX Spectrum was a good home computer in many ways BUT put it up against the Commodore 64 and you will soon find that the "beep" command from the ZX Spectrum was INFERIOR in every possible way compared to the Commodore 64 SID chip.

The ZX Spectrum was also INFERIOR in the graphics department compared to the Commodore 64 VIC chip.
The ZX Spectrum had NO built in Sprite availability but the Commodore 64 has.
The ZX Spectrum keyboard was NOT that good to start with. where as the Commodore 64 had a proper keyboard.

In fact the ZX Spectrum just can not compete with the Commodore 64 in a lot of areas.

The only thing I can in defence of teh ZX Spectrum was the education software that was spretty good.

But then again so does the Commodore have good education software.
Does the ZX Spectrum have a User port NO it dont, does it have a Serial port NO it dont.
Does it have a video port NO it dont (I am talking about the original ZX Spectrum 48k rubber keybaord model)

Does it have a 4k area for machine code purposes or other purposes, NO it dont.

And the TV display, well the ZX Spectrum was bad at the best of times but you switch on a Commodore 64 and you get a rock steady picture with good quality.

And as for the 8 colours that the ZX Spectrum had, the ideas dept had no f****** idea what so ever did they, where is the BROWN, where is the ORANGE, where is the LIGHT BLUE, where is the GREY1 and GREY2?

No sorry but the ZX Spectrum is good but NOT that good.

That lot is just for starters.

Mike......

2595. Re: XF551 ROM

Newsgroup: comp.sys.atari.8bit
Date: 2004-07-06 18:28:31 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <40EAEF4F.35848D8E@students.uni-mainz.de>
Source record: 15151

Hmmm,
with the original XF551 OS this might be one of the various OS bugs,
like:
- you changed the disk density (drive hangs up; try again!)
- you changed disk density and more: 90k => 360k thats a change from SS,
SD, FM => DS, DD, MFM (the same problem the other way around; the drive
completely crashes, switch off drive and back on again)...
- your disk has 2 index holes (quite uncommon)...
- on Chinon XF551 drives, when you put in the backside of a disk with
only 1 index hole, the drive never stops spinning (meaning, a Chinon
XF551 drive mechanic cannot read, write, format the backside of a disk;
a Mitsumi mechanic can at least read/write the backside of a formatted
disk)

Since I have two XF drives for many years now, it seems that the SIO
ports are not good connected; plugging and unplugging the SIO cables
very often will damage the SIO port connection to the pcb (normally an
XF551 drive has to SIO ports, my two XF drives now have only one working
SIO port each)... -Andreas.

At least he did not use a commode but a real toilet unlike the peasants
of his day. You seem to be saying tapes take a long time to load, why
not use disk drives?

It was probably not directed at users such as yourself.
The ZX81/TS1000 was part of the hobbyist era of computing
which changed into the consumer-user era in 1983ish.
The hobbyist era was made up of academics, tinkerers and
want-to-be programmers. It was probably the last computer
that was sold in kit form so that tinkerers could have the
pleasure of putting it together themselves.

What was significant about the ZX81/TS1000 was that it
was reduced to just 4 ICs, making it very cheap and
accessible to a large audience of those who wanted a
computer but couldn't afford one. This made it into
the first computer to sell more than a million units
(yes, before the VIC-20). There was a time when
the TS1000 was outselling Commodore, Atari, Apple and
Tandy combined. In the 4 IC design, through
some clever hardware tricks the Z80 CPU was actually
responsible for drawing the display. Unfortunately this
meant that more than half the computation time was used
to draw the display, making it half as fast as you would
expect from its clock rate. A FAST mode was added where
the Z80 didn't draw the display (so you had a blank
screen) that doubled the computation speed of the computer.
Even in SLOW mode, the ZX81/TS1000 still had about the
same computational power as a C64, eg.

The display of the ZX81 was claimed as 32x24 text and
64x48 pixel resolution on the tin, but because the display

is drawn by the Z80 using a combination of software and hardware tricks, clever individuals took advantage of this to create software drivers that would generate a pseudo-hi res 256x192 display. It was pseudo-hi res because only 128 of the possible 256 bit patterns within a byte could be generated (which patterns were available was up to you). With small hw mods, you could have true hi-res capability.

It came bundled with a capable Basic and, of course, the same Z80 microprocessor used by the "real computers" with full Z80 bus expansion on the back, which made it attractive for the tinkerers.

There is a lot of cleverness in the ZX81/TS1000 design and this was what made it popular with the tinkerer crowd. Just about every hw addon imaginable was available, including disk systems with CP/M available. Someone interested in the consumer end of things probably wouldn't appreciate it much and would give up on it quickly. You shouldn't have bought one :-)

The focus of computer design changed particularly with the arrival of the C64. The C64 is clearly a game machine first and a computer enthusiast's machine second, and this pretty much describes the consumer-era of home computing that began in 1983ish.

Alvin

At some point in the past (Tue, 06 Jul 2004 17:35:46 GMT, as it
happens), somebody called "Jonathan Herr" <dracosilver@wi.rr.com> made
the following views known to all at comp.sys.sinclair
>
> Hey it's funny to see how people take sides in these 'wars'... it
> shows how divided us old skool computists are...
>

Honestly, this kind of thread was funny in about 1995, but this is 2004,
and, really, trawling through page after page of 'The
Speccy/C64/Amstrad/Ataril/MSX/Oric/Apple IIc/Babbage Difference Engine was
crap!' holds about as much appeal as being forced to listen to an endlessly
looping tape of Westlife's version of 'Mandy' by Barry Manilow.

I just can't believe the stupidity of all the people who are rising to the
bait; I really can't. Let this thread die the undignified death it
deserves.

I think the ZX81 was the best 8 bits computer because you had to make
most of your programs. Check out ZX-91 the newsletter made entierly
and only with a ZX81 at "http://www.zx-team.de/andre" then tell me if
you still think the the ZX81 or his cousin the Timex 1000 is a crap
computer. What I read so far is words words. Look up ZX-91, it is a
solid reality. ANDRE***

according to www.googlefight.com (just go and check it)

Oric wins "ATARI 800" (in brackets please)
C64 wins "Sinclair Spectrum"
"Sinclair spectrum" wins Oric (unfortunately)

:)

I thought that was what Wintel users had been doing for the last
20 years ;-). Or you could upgrade the TS1000 or write better code.

If you want to compare the ZX81 to a Commodore, don't use the C64. Instead, compare the ZX81 to the VIC-20. Then the poor ZX81 might have a chance of winning... but I doubt it!

If you want to compare the original Spectrum to something, be fair about it. Compare it with the C128. If I remember correctly both were introduced in 1985.

Bringing the SAM Coupe into this discussion is simple insanity on your part. You only prove that Sinclair users are unable to tell the difference between apples and oranges.

If your country is the US, I am talking about your country.
You may have been too young or involved in computing too
late to be aware of it, but I assure you I know what I am
talking about. In the period of time being referred to,
the C64 was very young and was still not selling as well as
the VIC-20.

Well, well... Sure you know that this is a "no-problem" under Linux,
so possibly it's my chance in a lifetime to advertise Linux a bit? (-;

Ok, seriously, I'd need to consider this. It basically means that I've
to understand how low-level serial I/O works for the win32 platform.
Major problem here might be to get all the timing right; the basic
trick for the linux version is Hias' kernel interface (thus, a big
"thank you" to Matthias Reichl at this place), allowing the serial
driver to use all the possibilities a kernel module can have,
including decent timing. Possibly a modern machine might be fast
enough to do that in user space, and even under win32. Possibly,
as win32 is not a real-time Os either.

So long,
Thomas

Hi Alvin,

> In the 4 IC design, through
> some clever hardware tricks the Z80 CPU was actually
> responsible for drawing the display.

That's actually not that uncommon for this area of computing.
For the reference, the Atari 2600 neither had a frame buffer.
It was the CPU who had to load a three-byte "line buffer" in
the "graphics chip", the TIA, to draw something to the screen.

Thus, it basically came with a little RAM, the CPU and the
TIA, which also generated the sound. The 2600 doesn't qualify
as home computer though, it's more like a game console.

Another "original" design without a frame buffer is possibly
the Odyssey II, sold by Magnavox in the states and as G7000
by Phillips in Europe. It's basically a four-chip design as
well, with one graphic/sound chip, a tiny bit of RAM and a micro
controller (all intel based). The graphics controller had no
frame buffer either, but was rather able to draw a grid/labyrinth
as background, and quite a number of "sprites" in foreground.
"Character graphics" was done by placing sprites in position.
That's of course more advanced than the 2600 or the Sinclair
design already, but ugly enough to qualify as "original" in
my view. (-;

So long,
Thomas

It's a pun. And you shouldn't take anyone on this thread seriously, because
it's so obviously a lame troll that you - yes you - have been schmuck-
baited by, into continuing a tedious debate that's gone on for *exactly*
twenty years, and which *always* hinges around the same argument (the
graphics issue). Face facts, people, not one C64 owner is going to admit
that the Spectrum was better, and vice versa.

A line buffer as in a buffer for a *whole* TV scanline? Sounds like a
blimmin' luxury to me! The ZX81/TS1000 had no such exotic capabilities!

> Commodore 64 SID chip.

Absolutely, totally and utterly.
Importantly, though:
- The 16k & 48K Speccy DOESN'T HAVE a sound chip. Small number of
components- a mimimalist approach. It was for computer enthusiasts-
it wasn't actually built for games (Although that was what it was
primarily used for in the end, long after it became outdated). Cheap
and efficient. The anthesis of Wintel.

- The 128k had the standard AY sound chip used in arcades & later the
Atari ST, and the ability to use the 'beeper' too. 4 channels in
total. Rarely sounded as cool as the SID, though. When it did, it was
fantastic.

>
> The ZX Spectrum was also INFERIOR in the graphics department compared to
> the Commodore 64 VIC chip.

- Yep. The C64 was too slow to do much in high res (Spectrum) mode,
though. Importantly, IMO, monochrome speccy games usually looked
better/more tasteful than the vile brown blocky mush in a lot of C64
games. You *could*, of course mix high and low res which is what
people sometimes did. This looked great.

> The ZX Spectrum had NO built in Sprite availability but the Commodore 64
> has.

- Yep, it wasn't built for games. In theory, C64 games should be
better, and yet...

> The ZX Spectrum keyboard was NOT that good to start with. where as the
> Commodore 64 had a proper keyboard.

I would say the C64 keyboard was just as unusable for the opposite
reason as the Speccy- horrible huge typewriter keys, there's no way
you can really type fast on them. Even worse than the Beeb. I would
say that even the Speccy + had better keys, and certainly the Amstrad
CPC type keys later on. Some might disagree.

>
> In fact the ZX Spectrum just can not compete with the Commodore 64 in a
> lot of areas.

and that's how it should be - the C64 is from a different generation
(wrong word, maybe) of machines, built for a different purpose, and
yet the Speccy still beats it from time to time.

>
> The only thing I can in defence of teh ZX Spectrum was the education

> port NO it dont.

In all seriousness, what's a user port? The speccy had two major
expansion devices- the Interface 1 (with RS232 & connection for
Microdrives, which were err, lots of fun), and the Interface 2 (a
'games' expansion with Joystick ports and rom cartridge slot).

I used the Romantic Robot 'MultiPrint' for my printer which had a
built in NMI. Which was nice. Also, the Multiface was essential (much
like the Action replay for the C64.

Not sure if you could actually plug all these things in at once. I
never had an interface 2, anyway.

Notably, the Speccy also doesn't have joystick ports built in.

> Does it have a video port NO it dont (I am talking about the original ZX
> Spectrum 48k rubber keybaord model)

No it DOESN'T.

>
> Does it have a 4k area for machine code purposes or other purposes, NO
> it dont.
hmmm.

>
> And the TV display, well the ZX Spectrum was bad at the best of times
> but you switch on a Commodore 64 and you get a rock steady picture with
> good quality.
Not sure about that. The speccy had a nice, bright display, whereas
the C64 was pretty dull. I never had problems with tuning ether of
them. The speccy display just looks... nicer.

>
> And as for the 8 colours that the ZX Spectrum had, the ideas dept had no

> ORANGE, where is the LIGHT BLUE, where is the GREY1 and GREY2?

15 colours. The spectrum has 15 colours. All displayed on screen - two
shades of each primary and secondary colours, two shades of white and

one black. If you're going to have 15 colours, this is the most
sensible choice.

If you don't know, this includes two shades of cyan as well as two
shades of blue in case that's what you mean by 'light blue'. Colour
restrictions are the same as the c64 high res mode - minus the
sprites, obviously, plus you can't have two different 'bright' colour
values in the same cell.

I think our visitor Patrick Kain (Captain Kirk anag.)
rise paws (a?* wiper anag.) will not be back as yahoo
seem to have stopped his account the next day.

According to Google he received an account on 01-Jul-2004
and proceeded to post 1768 offensive posts of which this
one was the least offensive.

I could advise yahoo on how to cut down on spammers and trolls
but it is a closely guarded secret known only to me.

He has visited us before as Faith Dorell (an anagram of Adolf Hitler
and once again one of his first ports of call was alt.fan.adolf-hitler.

His subject last time was European Programmers and Musicians being
the best and once again this old saw reappears.

I've found that people who post hundreds of messages a day have little
to contribute and would best be confined to IRC.

Google have removed all of the Faith Dorell posts and I guess they will
now have to start on those of Patrick Kain. When I think of it, Google
too may be interested in my algorithm for getting rid of lamers.
Highest bidder gets it.

2622. Other XF551 Failure Modes?

Newsgroup: comp.sys.atari.8bit
Date: 2004-07-07 14:19:17 UTC
From: llppwhite@aol.comnsp
Message-ID: <20040707101917.11511.00001194@mb-m11.aol.com>
Source record: 15178

The problem with the XF551 SIO jacks/traces is well-documented, and likely the #1 cause of failure. But there must be other causes. Unfortunately, since the ROM is usually the only socketed chip, that really dampens "plug and pray" experimentation.

But have other folks seen/heard of MPU (8040/8050) failures or failure of the WD-177X/1772 or lesser chips in the 551? Any particular transistor issues (there are several on the board). Power supply section? I have seen one failure from a cracked trace adjacent the PS jack. And yes, these PS jacks seem to corrode badly.

There are also some devices on the board that I don't recognize -- FB2 and FB3. FB1, FB4, and FB5 look like diodes, but may not be. They do not have the usual "polarity stripe."

There is also a transparent-encased device next to the 8.33 MHz oscillator. On the bottom of the board, it lists this as C8, so it must be some type of a mylar cap. (?) I can read a couple of lines on this device:
330K
50L

Last, there is a blue-coated device labeled as LF1. (?)

As usual, it would be useful to compile the known failure modes, and that could help us keep these 551's alive and well.
Thanks,
-Larry

Actually, half a scanline. (Three bytes). It gets either repeated or
mirrored on the right half of the screen.

So long,
Thomas

> the "graphics chip", the TIA, to draw something to the screen.

You're right, simple video was not unique. However the Atari
2600, Odyssey 2 and others like them *had* a graphics chip that
could generate player sprites and characters, even if you
as the programmer had to do a lot of legwork to keep up
with the raster. I'm not too familiar with the Odyssey, but
on the 2600 the program would tell the TIA to enable certain
sprites within the next scan line during horizontal refresh.

This is not the same as what happens in the TS1000 -- there
is no graphics chip, the CPU does almost all the work in
displaying the video. There is a "frame buffer" - the display
file - that stores characters to display on a 32x24 grid.
The display file might be compressed if no RAM expansion
is attached to the computer.

As each scan line is drawn, the CPU actually executes
the characters stored in the display file as a program.
In this way the CPU progresses through the display file
as the raster draws its contents on screen. The display
hw watches the bytes read by the CPU during this time
and combines the character code the z80 reads with the
z80's I register during the refresh part of the instruction
execution to get a pointer into ROM containing a bit
pattern corresponding to that code. The display hw is
responsible for serially shifting out the 8 pixel
bit pattern read from the ROM pointer.

The display hw is also responsible for generating a
non-maskable interrupt at the horizontal scan line
rate from which the correct video timing is generated.
The cpu keeps track of which scan line the raster

is drawing.

The video system is a z80 cpu for video timing
and addressing the frame buffer + ROM to hold
bit patterns corresponding to characters stored
in the frame buffer + very simple display hw
that generates a periodic interrupt, serially
shifts out 8-bits of pixel data and performs
some byte stuffing on the z80 data bus.

The simplicity of the whole thing is what made it
so cheap -- it is certainly much simpler in hw
terms than what was in the Atari 2600. However,
it was not unique. A fellow by the name of Don
Lancaster also mentioned this technique of
generating video sometime in the late '70s, I
believe. It does require a Z80 cpu, however,
as it depends on using the refresh features of
that chip to quickly access video data.

Alvin

I remember seeing a LOT of Timex/Sinclairs. I wouldn't be surprised if they did outsell everyone else for a very brief moment. My recollection is that everyone and their brother was buying one, they were practically giving them away. The reason they're so forgettable is that no one actually used them. People were snagging them just so they could join the "computer revolution", then they discovered what junk they were. Most folks I knew who bought one felt ripped off, even at the $15 or $20 price. I remember several friends literally throwing them in the garbage after a month or two. The best thing I can say about my Timex/Sinclair memories is that it made me feel a whole lot better about my VIC-20.

Hey, that's really neat!
I only tried it for 5 minutes, but it seemed to work just fine.
I quickly loaded my "mule.xfd" image....a favorite.
Does it recognize USB joysticks?

I had a little bit of a difficult time getting used to the menus but they're similar to other emulators.

The emulator was running on my toshiba laptop (windows 2000) - 650mhz, 192mb ram.

-thanks!

I like Linux, I really do. But it isn't going to replace my Windows
OS yet. It just isn't all there yet. I do not want to debate this or
start an off topic Linux vs. Windows war. Just saying I plan to stick
with Windows on the desktop for now (I do feel Linux is stronger in
the server area).

I think it is possible as there are lots of device drivers and such
for things and also Steve Tucker has pulled it off at least reasonably
well with his APE for Win32. Maybe Steve could give you some
pointers. Maybe such a capability in the software would have people
looking to buy more premaid interface cables too. Never know.

>> it. Compare it with the C128. If I remember correctly both were
>> introduced in 1985.
>
> The original Spectrum is from 1982

Point taken. The C64 was introduced in 1982 and widely available by 1983.
The ZX Spectrum+ was introduced in 1984, but still might be a good machine to
compare with the C64. Lets see...

Processor:
Spectrum+ 3.54 MHz Z80A
C64 1 MHz 6510

The Spectrum has a slight edge here, but not as great an edge as it might at
frist appear. The 6502 family of processors, the 6510 included, use less
clock cycles for most tasks, that the Z80. So, the processor in the C64
would be roughly equivalent to a 2 MHz Z80.

RAM:
Spectrum+ 48Kb
C64 64Kb

Display:
Text:
Spectrum+ 32 Columns x 22 Lines
C64 40 Columns x 25 Lines
Resolution:
Spectrum+ 256 x 192 Pixels
C64 320 x 200 Pixels
Colors (Colours for the Spectrum ;-))
Spectrum+ 8
C64 16

Sound:
Spectrum+ 1 Channel, 5 Octaves
C64 3 Channels, 7 Octaves

I/O:
Spectrum+ Z80 bus, tape, RF television
C64 6510 bus, tape, RF television, Composite Video and Sound, Joystick
(2), Serial Port (disk drives, printers, etc. [up to 4 may be

daisy-chained]), RS-232 (user port, modems, adapter for PC serial
printers, etc.)

Storage:
Spectrum+ tape recorder or microdrive
C64 Datasette or disk drive

I would like to point out that although the 1541 drive is slow, there were
(and are) many expansion port cartridges available that would (can)
turbo-charge the disk performance of the C64/1541.

Note: I would like to give credit to the Planet Sinclair web site, which is
where I found the Spectrum+ specfications used above.

Well, ok - but limiting it to the "800" isn't particularly fair. That
excludes results from the 400, the XLs, the XEs, etc.

Oric vs. Atari 8-bit ... Atari wins

:)

At one time, Commodore offered a $100 discount to anyone who would trade in another brand of computer for the C64. Some stores sold Timex/Sinclairs for $10, so that their customers could get the discount on the C64. Rumor has it that Commodore gave most of the thousands of Timex/Sinclairs they received to charity, but kept a few for use as doorstops. ;-)

Sorry, I know, I already got a bug report about it and it'll be fixed
in the 1.37 - to be expected next monday. The corresponding file is a bit
uncareful in case no SDL is available. As a workaround, you could simply
replace directxsound.* by empty files, this should do it. (As both are
unuseful for the Os X anyhow since there is no directsound).

So long,
Thomas

As long as "SDL" recognizes them, yes sure. SDL is the media library I'm
using as front-end, except for sound. Under linux, it requires the joysticks
in the specific device files, e.g. /dev/js0.

Well, the SIO protocol is well-documented, and there is already code
in there that implements it. The "only" problem that requires solving
is how to control the individual lines of the serial port under win32,
but I'll find a solution for that. There's also enough documentation in
the MSDN.

So long,
Thomas

Hi Alvin,

Thanks for your explanation, sounds really quite bizarre.

> As each scan line is drawn, the CPU actually executes
> the characters stored in the display file as a program.

Lemme, ask, just a series of "load" instructions to put the
data on the bus where the video hardware fetches it?

> In this way the CPU progresses through the display file
> as the raster draws its contents on screen. The display
> hw watches the bytes read by the CPU during this time
> and combines the character code the z80 reads with the
> z80's I register during the refresh part of the instruction
> execution to get a pointer into ROM containing a bit
> pattern corresponding to that code.

Hmm, how do you get access to CPU registers from outside the
CPU. I don't remember any feature like that for the Z80?

Possibly, does the hardware expect the CPU to put the value
of I onto the bus, e.g. during horizontal blank, to fetch it
as an offset into the character ROM (i.e. to get hold of the
character row, that is).

> The video system is a z80 cpu for video timing
> and addressing the frame buffer + ROM to hold
> bit patterns corresponding to characters stored
> in the frame buffer + very simple display hw
> that generates a periodic interrupt, serially
> shifts out 8-bits of pixel data and performs

"Hand made" video hardware by just a couple of
standard gates, I suppose. B & W only display, naturally.

Wew. I don't know what impresses me most. The ability
to build such a beast, or the ability to actually make
something useful and program this stuff. (-;

So long,
Thomas

> printers, etc.)

But you could plug monitors, printers, modems, joysticks, etc into the
Spectrum via a suitable interface on the edge connector. Dedicated ports
are nice but this is computing the cheap and cheerful Sinclair way!

No idea where that 5 octaves figure is plucked from, but it's clearly wrong. The 48k sound hardware is just a speaker sitting on the end of an I/O port, with all tone generation done in software - as such, you can quite happily go into ultrasound (provided your speaker's up to the job) or play a square wave with a period longer than the age of the universe.

BEEP from BASIC allows pitch values between -60 and +69 giving a range
of five octaves either side of middle C and a few more notes for good
measure at the high end. I guess the five octave figure comes from a
misrepresentation of BEEP's mighty abilities!

2646. Atari-friendly "Dos Printer"

Source record: 15203

hi!

im trying to write SAP player. im reading pokey registers specification
but i dont understand what is the the "polynomial counter".

"... there are three polynomial counters used do generate random noise
..." - does it mean that these counters are used only to generate a noise?

what is noise - is it some random sound generated at some frequency or
maybe some kind of exact wave, not square, but called "polynomial noise"?

how can these polynomial counters sound like? are they similar to
ocean-waves..?

The conclusion is:

There exists no adapter between Atari XE/XL and some RGB monitor with
right color displaying.

(Clarence Dyson's interace changes the colors, that's bad!)

I am thinking about building an interace with some integrated circuit. Has
anybody tried it?

No, The Z80 Jumps (JP) to the start of the display file (With A15 set). The hardware detects A15 being set and copies the results of instruction fetch (The actual character to be displayed) while forcing 0 (NOP) onto the data bus of the Z80.

This byte is combined with the I register (Which gets put onto A9-A16 during the refresh cycle) and the contents of a 3 bit counter to get the address of the characters bitmap in ROM. The contents of this address are copied into a shift register which in turn get spit out to a TV.

> I was searching for some schematics of rgb adapter on the Internet but I have not found any... <

Radio-Electronics magazine (U.S.) published an article in the early '90's with a schematic to convert *NTSC* composite to RGB. IIRC, someone in csa8 built one and it "sort of" worked. I have no idea if the person ever finished the project. You might search the Google Groups to see if there is any useful info.

Beyond that, it may be possible to convert the video in two steps: 1) Convert the Atari S-Video to Component Video. 2) Convert the component video to true RGB. But this is big $$$, especially step 2.

You know what you want, but in this case, it's going to be difficult and/or expensive.

Larry

I left out a few details :-). The Z80 has built-in
refresh logic which is being used here. A Z80
opcode fetch consists of the usual read from memory
followed by a refresh cycle for attached DRAMs
that occurs while the instruction is being decoded.

The DFILE stores character codes for each row of 32
characters. The Z80 executes those character codes
as a program; this consists of successive opcode
fetches. The display hw watches the opcode read
(the character code) and latches it. It then stuffs
a 0 onto the Z80 data bus which causes the Z80
to execute a NOP instruction, not the character code
it read from the DFILE. Each character code fetch
therefore takes 4 cycles, which corresponds to the
execution of a NOP instruction. This 4 cycle length of
time corresponds to the amount of time needed to
traverse 8 pixels by the raster.

Anyway, as the Z80 decodes the NOP instruction,
it performs a refresh cycle. During the refresh

cycle the Z80 usually places the contents of IR
on the address bus (the I register on the top 8 bits
and the R register on the bottom 8 bits). The
I register, in the TS1000 scheme, points at the
base of a bit pattern table in ROM. The lower
8 bits of the address bus which would ordinarily
contain R is replaced by the display hw by a
combination of the character code read from the
display file and a scan line counter generated
by the display hw. The scan line counter just
counts from 0-7 repeatedly. Each row of the
display file is "executed" by the Z80 8 times,
with the scan line counter incremented between
each horizontal scan line. In this way each
character can have a height of 8 pixels and
a width of 8 pixels.

The z80 signals a refresh cycle by asserting
/MREQ (memory request) and /RFSH (refresh).
The display hw also asserts /RD (read) at this
time, causing the ROM to place the bit pattern
on the data bus during the refresh cycle (recall
the address = I register in top 8 bits, the
bottom 8 bits being a combination of the char
code and scan line). This is how the
display hw gets its bit pattern. It then
shifts this out serially to the TV.

It is not a mere coincidence that the TS1000
had 2K of SRAM memory and the zx81 had
1K of SRAM -- these do not require refresh
which is handy when your display hardware
hijacks the usual means of performing DRAM
refresh :-) The 16K/32K/64K RAM packs
had to contain DRAM memory to be reasonably
priced and these addons had extra logic to
restore the hijacked refresh cycle within
them.

A complete description of the zx81/TS1000
video scheme can be found here:

http://home.germany.net/nils.eilers/zx81/wilfvid.htm

Wilf has also designed a discrete TTL version
of the same video system which you can find
with some googling if you are so motivated.
As you can imagine, it is surprisingly simple.

I couldn't find Don Lancaster's work online
to compare. His contributions were published
in 1979 and it looks like that book is the

only technical source for his work.

Hi Alvin,

as you know I am not good at explaining hardware.

This is Don's TV Typewriter which contains influences of the Sinclair
display system.

http://www.swtpc.com/mholley/RadioElectronics/TV_Typewriter.htm

According to John Grant who wrote the ZX80 BASIC the system that
appeared in the later Video Cookbook inspired the ZX80 display.

Yours was a clear explanation. I may borrow a phrase or two.

Cheers,

Vlad, you said you wanted to use an old monitor so you don't have to pay for
a colour TV with an S-video input.

You've been thinking about your idea for at least two months.

You could have spent that time on a minimum wage job and bought a TV.

Or sold your old PC monitor to get money to help buy the TV.

> I am thinking about building an interface with some integrated circuit.
Has

Surely the fact that you haven't found such a circuit yet ought to suggest
to you that there are few good reasons to make one?

K.

> you can really type fast on them.

Well, i'd disagree with that - i learnt to type on a breadbin C64 and back in the day had an average speed of 80WPM with over 95% accuracy according to a test i took around 1987. These days i'm closer to 70WPM but that still applies to the C64, in fact the only key i find "unwieldy" is the restore key and that's supposed to be harder to get a reaction out of.

> In all seriousness, what's a user port?

A sort of hybrid, it can do a number of things involving parallel data transfer. Most common uses i've seen are RS232 printer connections, using the reset line and custom machine-to-machine link up cables for cross assembly but there are others and a lot of things that need to drop data in a relative hurry go through there.

> The speccy had two major expansion devices- the Interface 1
> (with RS232 & connection for Microdrives, which were err,
> lots of fun)

There was a wafer drive put together for the C64 that hooked into the tape port, i got one labelled as a "Quick Data Drive" for a tenner at one of those Earl's Court events and it chewed it's boot wafer two days after i got it home!

> Not sure about that. The speccy had a nice, bright display, whereas
> the C64 was pretty dull. I never had problems with tuning ether of
> them. The speccy display just looks... nicer.

That's really just personal taste i'd say; i've always felt the Speccy colours were *too* primary and i prefer the more subtle shades of the C64. The Atari is sort of in the middle, not as subtle as the C64 but loads of colours. =-)

Oh, is this just a troll-induced skirmish or has the flame-war officially started for this year...? =-)

The way that I understand it, polynomial counters are not sequential counters (1,2,4,8,16, etc...) they are more like 1, 9, 4, 2, 18. You can select various "taps" to output to the audio circuitry that will make a note ranging from "pure" (near the start of the line), to very random (near the end of the line). The pure tones would be for music or beeps/boops, while the random tones would be for, say, engine growls.

From what I understand, using a "normal" counter would give you a simple square, but using a polynomial counter gives you more flexability because you can generate pure tones as well as "random" noise.

That may be right.... Check the Hardware manual for the 400/800. the circuitry is in there or check out De Re Atari, I think it explains it too.

CSS is crap. In a funky skillo sort of a way. (Ah, they'll have a field day
with that one).

I did a search on Patrick Kain, incidentally, and he's trolled thousands of
groups. But only this one provoked an actual debate. (With in-depth
technical gubbins about 'clock speeds' and 'memory dumps').

Exqueeze me?

If I recall correctly, the Sam Coupe was released.

If I recall correctly the C65 wasn't.

You may return to your crayons now.

Troll-induced skirmish. It won't take too long before those Comode
chappies realise it was a troll.

:-P

I once knew of a sysop who had his BBS in his bedroom. He was often awakened
in the wee hours of the morning by the noise from his 1541 drives. Or, so
said he, in explaining why he switched to 1581 drives. (I suspect the extra
storage capacity may have had something to do with the switch also.)

Isn't it fairer comparing the Oric (basically a single machine) to something like the 800 - a similar machine - rather than comparing to half a dozen machines ?

Steve M
PS who cares anyway ? I know what I like and that's what matters to me !

Not really. When you search for Oric, you are getting pages related to
the Atmos, Oric-1, Telestrat and others. Atari 8-bit is fair, Atari
wouldn't be, because then you'd get the games consoles, 16/32-bit,
Transputers, Atari Games, etc. It's not important of course, just my
reasoning.

I agree !! for it to be valid test you should be comparing things like Date it was released, Cost, Memory size, Graphic capabilities, CPU speed, Basic functions, connectivity, expansion possibilities etc

Of course as far as I'm concerned My telestrat kicks ass!!

I'll argue that the Spectrum (rubber key version) was both good enough for the market place, and way cheeper than the C=64 and Atari 800. For the UK price of either the Atari or the Commodore you could buy 2 and a half to 3 Spectrums (untill the prices came tumbling down in 85-86)! But considering that you got twice the machine of the spectrum, maybe that is fair. Unfortunately both the C=64 and the Atari 800 only really came alive with a disk drive (making all in cost close to 5 or even £600) and the spectrum would cost only £130 and used fast loading tapes from regular tape decks (which were also cheep if not free to most of us). Most Spectrum owners will not admit it but we bought the speccy because it was the best supported and most capable machine we could afford!

Certainly the sinclair ZX81 and Spectrums get the prize for achiving so much with so little, but the C=64 and Atari 800s were for a long time the pinicle of 8-bit computing capability, and certainly more widely supported than the late arriving MSX-2, Elan/Enterprise or the Sam Coupe', all 3 of which were overshadowed by the arrival of simmilarly priced but much more capable Motorola 68000 based machines.

Masterpeice, of efficient minimalist design, yes, the best? Well I own Spectrum AND (several) Atari machines, which should give you an idea of where i stand on both these machines ;0)

Definitely. It comes from using a retro machine that was once
the most popular computer in the world. When the Playstation
has finally had its run, the retro Playstation people will be
more serious than the retro Sega Dreamcast and X marks the Box
people.

>people.

Pah! Don't you believe it! I'm a PS2 owner, and I know an X-Box owner
and a Nintendo Gamecube owner[1]. Those two are dead serious about
their machines, can't take any jokes about them whatsoever.

People with the most popular machines are less serious. Look at the
humour in CSS, and the po-faced mumblings in CSC. Aye thank yew.

[1] Thus meaning I know 50% of their user base, hur hur hur.

Hi,

I like to develope a PBI-card and I'm looking for the following
dokumentation to programm the software as compatible as possible.

SURELY O.S. Rom Specification, S. Scheiman R. Nordin
Software Implementation of Parallel Devices, R. Nordin

Has ever anybody came across these dokuments. I managed to get
basically all docs on the hardware specifications.

I would highly appreciate any help in that direction.

Regards
Frank

Frank,

there was a 4 part series in Analog (or antic) magazine regarding the
parallel port. I don't remember the issues, but you may want to check
them out. They're on the web, copied courtesy some fine atari fans.

Tony

I'll grant you that the Spectrum was the most popular 8-bit machine in the
UK. However... worldwide, the C64 was much more popular. (Reference:
Guinness Book of Records) ;-)

How's that for humor?

2690. Text Adventure Data Structures

Newsgroup: comp.sys.atari.8bit
Date: 2004-07-10 20:41:53 UTC
From: Paul Allen Panks <panks@sdf.lonestar.org>
Message-ID: <ccpkah$8uh$6@chessie.cirr.com>
Source record: 15047

"Text Adventure Structures"

Since the mid-1970s, attempts have been made to write text adventures using a variety of methods. Zork (to use an early example) was originally written at M.I.T. on a PDP series mainframe (using an obscure programming language known as MUDDLE). Zork was then translated into FORTRAN IV by unknown persons, and by 1979 Infocom was formed to sell Zork to the computer industry at large.

The fact that Zork was plainly inspired from the original Adventure by Will Crowther and Don Woods suggested that adventure games were appealing enough to stick around for awhile.

By the time Zork took off, smaller memory personal computers were becoming commonplace. And so many people took it upon themselves to write adventure game drivers to fit an entire adventure game into a limited amount of RAM. People like Scott Adams and David Malmberg developed adventure games based on the two-word parser of the original Adventure.

The structure of a text adventure is essentially the same today. You have several key components, including the parser and data structures. The parser can be a simple (or complex) routine. It is essentially responsible for breaking down small sentences into individual words useful to the computer. Once matched against an array of data within the data structures themselves, the computer then branches to specific subroutines in order to effectively process the inputed data.

Data structures (on the other hand) rely both on numerical and alphanumerical data. Since data structures are almost entirely made up of a word list, the computer adventure can convert each word or phrase into a number used by the parser. So one can have an almost limitless word list consisting of verbs, nouns, adjectives and common phrases.

Just what does a parser or data structure look like? While a parser can vary wildly from one adventure to the next, data structures are more or less the same

across all adventure games.

A very simple two-word parser might look like this:

```
100
v=0:n=0:ne$="":n$="":n2$="":v$="":v2$="":pr=0:pt=0:nm=0:bz=0:FOR
X=1 TO 10:wd$(x)="":NEXT x:INPUT
A$:pt=1:nm=0:D$=A$:FOR a=1 TO LEN(D$)
101 IF MID$(D$, a, 1)=" " THEN A$=MID$(D$,pt,a-pt):
pt=a+1:nm=nm+1:wd$(nm)=A$
102 NEXT a:nm=nm+1:a$=MID$(D$$,pt,a-pt):wd$(nm)=A$
103 v$=wd$(1):n$=wd$(2):IF wd$(3)="and" OR
wd$(3)="then" THEN v2$=wd$(4):n2$=wd$(5):co=1
104 IF wd$(3)="in" OR wd$(3)="from" OR wd$(3)="to"
THEN v$=wd$(1):ne$=wd$(2):pr=1:bz=1
```

What lines 100 through 105 accomplish is to break the sentence into individual words, and then assign each of those words into a string array -- wd$(nm). "nm" equals the number of words entered in this case. The parser also allows from complex commands, including PUT and GET FROM (e.g. "put medallion in bag", "get medallion from bag", "give medallion to hobbit", etc.)

The next step is to check the entered data against a word list. This can be accomplished as follows:

```
105 v=0:FOR x=1 TO 30:IF v$=vb$(x) THEN v=x
106 NEXT:IF v=0 THEN PRINT"What? Check your
verb.":GOTO 100
107 n=0:FOR x=1 TO 299:IF ne$=no$(x) THEN n=x
108 NEXT:IF n=0 THEN PRINT"Huh? Check your noun.":GOTO
100
109 ON v GOSUB 120,130,140,150,160,170,180,190,200,210
110 IF co=1 THEN co=0:GOTO 105
111 GOTO 100
```

Note Lines 105 and 107. Line 105 assumes the data table has a total of 30 verbs, and checks it against the values stored in vb$(x) or v2$. If a match is found, v is set to x (v=x), and the parser jumps to Line 106. If a match is not found (v=0), then the message "What? Check your verb" is printed out and the parser returns to Line 100.

Line 107 checks for a valid noun, and assigns n to x if found (n=x). If not, n=0 and the message "Huh? Check your noun" is displayed, sending the parser back to Line 100.

Line 109 branches off to verb subroutines based on the value stored in v (ON v GOSUB...). In my own verb table, I set my verbs as follows:

1 - Go
2 - Get/Take
3 - Drop
4 - Inventory
5 - look
6 - examine
7 - read
8 - use
9 - climb
10 - light

Ten verbs should be enough for most adventures, although with a larger verb list, the adventure game can become far more playable and interesting.

Also, note Line 110. IF co equals 1 (IF co=1), then we set it back to 0 (THEN co=0) and hop back over to process the input again (to Line 105). This ensures that if a larger command has been entered -- "get sword and then go east" -- the parser recognizes it and works each command separately ("get sword" followed by "go east"). The advanced Infocom parsers used in Zork and other adventures utilized such a parser system.

Now on to data structures. What do they look like? Well, they can look like anything you want, so long as they contain the basis of the adventure game. For the purposes of this article, I will list a short data table and explain what each DATA statement means.

A simple data table might look like this:

```
500DATA"go",1,"get",2,"take",2,"drop",3,"inventory",4,"look",5,"examine",6
501DATA"read",7,"use",8,"climb",9,"light",10
502DATA"north",99,"south",99,"east",99,"west",99,"up",99,"down",99
503DATA"lantern",17,"oil",5,"torch",6,"book",12,"food",1,"wine",1,"water",2,"well",2,"alta
r",5,"bible",5
504DATA"rope",6,"barrels",6,"knapsack",6
505DATA"ogre",23,"werewolf",18,"villager",2,"clerk",3,"priest",5,"bartender",1,"paladin",1
7,"hobbit",24
506DATA"goblin",28,"knight",31,"barbarian",29,"dragon",20,"vampire",33,"ghost",38,"spider"
,40
```

Lines 500 through 501 list the appropriate verbs understood by the adventure game. In this instance, the verbs are followed by the appropriate verb number. The verb number is important because you can assign multiple verb names to the same verb number. In the case of "get" and "take" verbs, this branches to the same routine simply because both verbs do essentially the same thing. Such a verb list would allow you to create an entire dictionary of verbs that are

different words but do much the same action or actions.

Lines 502 through 506 contain the noun list used by the adventure. Each name is again followed by a number. But this time each number isn't a noun number, as it was in the above verb list. No, this time we are actually listing the noun locations for each object. For example, the lantern is located in room number 17, the oil in room 5, and the torch in room 6. This may also relate to monsters throughout the adventure, as the "ogre" lives in room 23, and the "werewolf" in room 18.

This simple data table is very limited, but it can be used as the starting basis for a more complex adventure. Also, remember that the player needs to be able to move about the adventure game. A data table for moving about the adventure would suffice as well.

Such a data table might resemble the following:

```
507 REM N, S, E, W, U, D
508 DATA0, 2, 0, 0, 4, 0: REM Room 1 (Tavern)
509 DATA1, 7, 3, 5, 0, 0: REM Room 2 (Village Well)
510 DATA0, 0, 0, 2, 0, 0: REM Room 3 (Town Shop)
511 DATA0, 1,10, 0, 0, 1: REM Room 4 (Upstairs Hall)
512 DATA0, 0, 2, 6, 0, 0: REM Room 5 (Village Church)
513 DATA0, 0, 5, 0, 0, 0: REM Room 6 (Storage Room)
514 DATA2, 8, 0, 0, 0, 0: REM Room 7 (In the Forest)
515 DATA7, 9,11,12, 0, 0: REM Room 8 (By a Clearing)
516 DATA8,13, 0, 0, 0, 0: REM Room 9 (On a Bridge)
517 DATA0, 0, 0, 4, 0, 0: REM Room 10(Small Room)
518 DATA0, 0, 0, 8, 0, 0: REM Room 11(By the Lake)
519 DATA0, 0, 8, 0, 0, 0: REM Room 12(By a Boulder)
520 DATA9, 0, 0,14, 0, 0: REM Room 13(By the Castle)
521 DATA0, 0,13,15, 0, 0: REM Room 14(In the Hall)
522 DATA16,0,14, 0, 0, 0: REM Room 15(In the Parlor)
523 DATA0,15, 0, 0, 0, 0: REM Room 16(By the Throne)
```

Line 507 is a REM statement that doesn't do anything remarkable. But what it does list is each cardinal direction the next DATA statements correspond with. So the first column of each DATA statement which follows represents the movement direction of NORTH, while the second is SOUTH, the third EAST, the fourth WEST, the fifth UP and the sixth DOWN. Notice that each of these DATA columns corresponds to a room location number. Lines 507 through 523 are thus the basis for a 6-directional map for a 16 room adventure game. It can obviously be expanded to include many more rooms, but this will suffice for now.

There is much more to the structure of an adventure game than either the parser or data tables themselves. The length of such an explanation is beyond the scope of this article. However, a storyline and introduction would help the casual game player to understand what your adventure game is all about. You might also add in the ability to talk to game objects (such as the villager or clerk), face combat with various monsters (such as the werewolf or barbarian) and handle random gaming events (such as time, weather, magical rooms, etc).

As you can see, the structure of an adventure game (even the parser and data structures) is fairly straightforward. Even a novice with little coding experience can sit down and write a simple text adventure in as few as three weeks. All it takes in imagination, a willingness to learn and the ability to develop a storyline.

The limits of the imagination (and available RAM) are the only limitations to what you can accomplish while writing a text adventure.

Sincerely,

Paul Allen Panks

> er...um.....should I know what an "SDL" is?

This is the "simple direct media library", actually the part that does all the interfacing towards graphics and joysticks and sound (up to the 1.35, no longer now). Thus, atari++ can do joysticks as long as this library can. Which, honestly, I don't know for USB style joysticks, but since the lib interfaces with the win32 system and is of good quality, I would highly believe so.

So long,
Thomas

2696. CD ROM (what can I burn)

Newsgroup: comp.sys.atari.8bit

Howdy folks

Anybody know if it is possible (with the right image ofcourse) to burn whatever you want on a CD ROM?

And if we want to use 512 byte sectors, and we want this CD ROM to be readable by anything that expects ISO9660, do we place the PVC on sector 16 (as with ISO9660) or do we have to put it somewhere near sector 64 (2048 bytes normally divided by 512 bytes now is 4. 4 times 16 is sector number 64.)

CU Mathy van Nisselroy

PS does buffer underrun proof mean even if one bit comes in every hour, it still won't go wrong or is there a minimum to the speed data should be delivered?

If you think the TS1000 is bad then you should have paid serious money for
Altair waited forever and got something that had LEDs for display and
toggle switch to change memory locations, the MK14 is better than that.
Any problems with the TS1000 could be got round, you just had to try or
get a Spectrum. It's pity Timex pulled out denied the US the pleasure of
the humble speccy, the did not reverse import the TS1500 and TS2068.

From: Paul Allen Panks <panks@sdf.lonestar.org>
Message-ID: <ccsftbnet4@chessie.cirr.com>
Source record: 15055

Oops, made an error. Line 103 should actually read:

```
103 v$=wd$(1):ne$=wd$(2):IF wd$(3)="and" OR
wd$(3)="then" THEN v2$=wd$(4):n2$=wd$(5):co=1
```

Note the "ne$=wd$(2)" and not "n$=wd$(2)". "ne$" sets the valid noun for the parser routine.

Sincerely,

Paul Allen Panks

not in my experience. before leaving the USA in 1986 the most common
computer i came across was the Timex and the ZX81 kit, then maybe the Apple.
Atari to me was still only a console in my mind since i had never seen an
Atari computer. one summer abroad i had the pleasure of using and playing
games on a relative's TC2068. this was in "my" case. you may say i was
living under a rock then but it doesn't change what "i" was exposed to. also
i never heard of the Commodore 64 until i arrived in Europe. One kid, a very
young cousin, had one. Sinclairs are my main machines, but i like them all
really.

Something like this (yes - I know it's not an Altair)?

http://www.evil.geek.nz/taxonomy/page/or/44

Lovely old thing. Very usable :)

sigh This was precisely my point.

It wasn't.

Bill's argument is like saying that the Lotus Esprit was utterly pants
because Star Trek Transporters would have been /much/ cooler if they'd
just gotten the jolly things into production.

Not that it matters. We now return you to your scheduled pointless
flame war.

2702. atari++ 1.37 ready

Newsgroup: comp.sys.atari.8bit
Date: 2004-07-12 09:04:23 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <cctk6n$q3d$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 15059

Hi,

the new 1.37 release of the Atari 8 bit emulator for linux and
windows, atari++, is available for download at its usual location:

http://www.math.tu-berlin.de/~thor/atari++/

This version fixes two aparent bugs of the latest 1.36 release. It does
not introduce any new features, though:

- Fixed a bug in the flashrom cart emulation; these carts could not be
disabled properly.
- Fixed a bug in the directxsound wrapper class that did not disable itself
correctly in case no SDL library was available.

Thanks for all the reports!

Thomas

The C65 exists in reality, where as Transporters are pure fantasy. In a
way it was released when Commodore went bankrupt anyway. People have the
machines, and if so inclined they could write software for it. The C65 in
hardware terms, an 8-bit Amiga, which would have even made the Amiga look
slightly dated...

2705. Museum of Computing summer newsletter

Newsgroup: comp.sys.atari.8bit
Date: 2004-07-12 22:04:00 UTC
From: swebb@cix.co.uk
Message-ID: <memo.20040712230409.36445G@swebb.compulink.co.uk>
Source record: 15062

This is now available for download from the Museum website

www.museum-of-computing.org.uk

It includes articles on:

- HP Calculator memories
- Personal robots of the 1980s
- Interview with Bob Metcalfe, Ethernet pioneer and 3com founder

Plus the usual news, events, book review, global museum feature and
`nostalgia' section.

2706. Karin Maxi

Newsgroup: comp.sys.atari.8bit
Date: 2004-07-13 03:12:42 UTC
From: Michael Current <hunmanik@earthlink.net>
Message-ID: <6kk6f05r1rgj40s0jvu8lhq6gbgsam94lt@4ax.com>
Source record: 15063

Can someone describe the Karin Maxi in a little detail? It's a device that
was produced by Karin in Poland.

Is it a drive, or an interface? 360K or 720 drives?
Is it a cartridge, an internal install, or a PCI/ECI connection?

I'm finding what looks like conflicting information on the web.

Any pictures?

Thanks,

-Michael

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

it's an interface, PB+expansion. you can basically plug any drive
drive, PC 3'5", 5.25", amstrad 3", there are pinouts even for 8".

the interface is known as interfering with some software, as it's
seen as a "New Device", so the software shouls use system calls to
communicate with it.

here are the schematics, pinouts, and chip dumps:

does anyone know how to get a hold of Ron Hamilton or know if he is still alive? I've not heard from him since last July 2003 and he's got my entire collection of Atari disks. I've emailed him (nothing bounces back so obviously his email is being checked by someone), snail mailed him, and called the only Hamilton in Blanchard, OK but got an answering machine.

does anyone have any info ?

Hmmm,
there was/is a SAP player for XE Ataris (meaning 128k RAM or more) by
EPI / Allegresse. While this is a good player which plays most *.SAP
files, it misses the DIRectory option (and since there are more than
1400 SAP files available this is quite awkward). Maybe you can
use/disassemble this player learn whatever you can from it and last not
least use it for your own player with DIR option... -Andreas.

P.S.: E-Mail me, if you are interested in this SAP player for XL/XE
Ataris with a min. of 128k RAM...

2716. Free to whoever wants it (in Mtn View, Calif area)

Newsgroup: comp.sys.atari.8bit
Date: 2004-07-14 06:35:21 UTC
From: bill@newbreedsoftware.com
Message-ID: <Ju4Jc.2254$54.25984@typhoon.sonic.net>
Source record: 15073

I've got the following not-so-useful-to-me stuff available for free,
to whoever wants to come pick it up in the Mountain View or Palo Alto
area (south bay area / peninsula area of California).

"Faster Blaster" controller. Seems like a flat membrane keypad that
acts as a joystick. ("Sheild, Thrust, Left, Right, Fire" buttons)

Atari CX85 numeric keypad.

"Crush, Crumble and Chomp", on tape, in box, with instructions (or at
least some of them). Dunno if it works, no tape drive. :^/

Two ~10 year old, slightly finnicky SIO2PC cables. (Connect PC to an
Atari and use it as a disk drive.)

Atari 850 RS232 device. (I always wanted one, but now that I have one,
I don't have much use for it.) I don't think I have the power adapter
for it, unfortunately. It's just the unit, untested, with no cables.

"The Monkey Wrench II" manual. I don't remember if I actually have
the CARTRIDGE. (If I do, it's not with me, but is in Davis. I'll try
to remember to look for it this weekend when I'm back up there.)

E-mail me privately, or post a response here, if you're interested in
any of this.

-bill!

Well, it's not Atari BASIC (or OSS BASIC XL/XE). The string functions
aren't for Atari BASIC. It appears to have limited use of
terminal/cursor control characaters, so it will probably run in some
other kind of BASIC for the Atari with little or no modification. It
looks like it was ported from the TRS-80 to some other BASIC.

Thanks,
Ken Jennings
(No, not the one who is a millionaire on Jepardy!, so don't ask for a
loan.)

Castle Adventure as I know it is a Commodore 64 adventure, which
also fits the neighbourhood Paul Panks comes from. Probably the
author, David Malmberg, built his adventure using an example
adventure found in CC/Byte, converted from TRS-80 to Commodore Basic.

Now Paul seems wanting help to convert this C64 adventure into
other computers (e.g. Atari 8-bit, ZX Spectrum, MSX etc), probably
to get a feeling for how typical adventure mechanisms would be
solved in each variant of the Basic language.

<SNIP>
It was Atari, then still a big name in the personal-computer business, that demonstrated the first CD-ROM encyclopedia at the Comdex trade show in Las Vegas. The crowds around the company's booth were enormous.
<SNIP>

interesting. too bad they didn't follow up on it.

Source record: 15080

Hello,
I have an XF551 and was wondering if anyone has plans / schematics or instructions to upgrade the unit to a 3.5" drive. I know it can be done with a 720k, can it also handle a 1.44MB as well? Also can a use a double system, a 3.5 and 5.25 in one unit on the upgrade? ANy help would be greatly apprecitaed.
John

a.k.a. oldatarian.

hes alive and well. took a couple more long distance phone calls to a mortuary of all places (hasn't bought his ticket there yet) but he's alive. unfortunately he told me he doesn't have internet access or an email address he can check (hmmm...) but we're working on getting my disks collection back. i asked him to post here as soon as he can telling him that he's got a few friends who miss him (not to mention a certain someone who misses his atari disks collection). If anyone wants me to pass along message drop me a line at sysop at rtdos dot com or post here.

mo, are you still around ?

as soon as we get my disks converted over to a format used by emulators (discommunicator, for example) i'll be hoping to post my entire collection online as soon as possible. any, um, volunteers ? :-)

I believe with this post you'll have your atari 8bit port
for b-venture?
http://groups.google.cl/groups?dq=&hl=es&lr=&ie=UTF-8&th=7fbea6927ff99341

are you going to upload a version to you web page?

cheers,

German

yes, possibly, i remember hearing (and seeing in a display case) an atari add on for the stfm series called CDAR, best electronics had a piccy of it on one of their old back catalogues, the devices was made by a californian/US company called activenture who did a JV with atari to 'try' and bring it to the mass market, I remember seeing this device in a display case at a UK atari fair in Ally PAlly (Alexander Palace, Where the BBC originally started doing their TV broadcasting experiments back in the late 20's and early 30's, just north of tottenham, north London)

There were two different versions and AFAIK, both came to market in
limited numbers. Quite a few ended up knocking around Europe. Trouble was,
there were no CDROMs to play on it apart from a 747 parts inventory and
other exciting things. Ahead of its time :-(

Then I add PeterPlus Sprinter (28MHz Z80 with 4MB RAM) or Jarek's
Accelerator or Si's Accelerator and the Spectrum/SAM wins.

In Lombard Illinois.

Visit the VGS website: http://avc.atari-users.net/Events/FestVGS.html
For more information about Video Game Summit contact Daniel Iacovelli at
AtariVideoClub@yahoo.com

The 2004 Video Game Summit is being held on July 17th, 2004 from 9am to 6pm at
the Lombard Inn and Suites hotel (Heron Point Building) formerly the Quality
Inn and suites hotel 645 West North Avenue, Lombard, IL.

I'll have a table there with some interesting items, boxed virtual boy, some
other boxed systems. Might bring a Best Electronics Waterworld "proto" Will be
selling AND trading, so check my "wish list". Feel free to post if you are
coming, I'd be interested to know.

Thanks,
Tom

http://TomMage.com/ Visit my Ultima Infocom and RPG page for a history of
Ultima (including pics of Ultima Escape from Mt. Drash), some nice music and
games for sale/trade.

Can I attach a PC to the back of my Spectrum? I bet
my 2GHz PC beats the SuperCPU hands down. As would
a z380 or ez80 :-) An original 20MHz z80
wouldn't quite do it. A z180 I'd have to look into to
see how fast they can go and how they modified the
instruction timings. It would certainly come with
a lot more interesting gadgets on chip.

I got this nice Atari 400 from the Thrift Store for .99 cents. Didn't know if it worked but for $1 who cares. I plugged it into my TV with a old TV Switchbox and it seems to work. BUT the video is really really bad. Snowy and crappy. I tried to hook up a 800 I had and the same thing. Also tried a 130XE and same. How can I get better video from the RF? (I also tried another TV, same problem)

Tim

Try 2K.

> It was a horrible computer.

Why? because it had a flat keyboard?
Because it didn't do colour (after all, it was only a zx81, not a spectrum)

> Personally I prefer the Atari 8-bits (and started out on a Atari 400)

Ahhhhh, you mean the one with the flat keyboard... um...

> compare with the C64. Lets see...

Why bother with the speccy plus? The spectrum was introduced in 1982.
It had exactly the same hardware as the + apart from the enhanced keyboard.

> The Spectrum has a slight edge here, but not as great an edge as it might at
> frist appear. The 6502 family of processors, the 6510 included, use less

> would be roughly equivalent to a 2 MHz Z80.

The z80 had a lot more registers how ever, so less need to address RAM.
The z80 had a heck of a lot more flexibility with its far more advanced
instruction set, so you could do more in the same amount of RAM.

No you're the idiot... The TS1000 was released in July 1982, the C64 in
January 1982. Even if the C64 wasn't around, the VIC-20 would have been
outselling it anyway. I think you owe someone an apology...

I haven't been around in this group for a looooooonnnngggg time.
Been reading the articles about movies on a XL/XE, nice discussions.
Download the next video-clip and have a look at it.

http://www.mr-atari.com/docs/mra_showing_matrix.mpg

It's done on my Atari 800XL with internal MyIDE 4.8G 2.5" HD.
With the use of new IDE-drivers (blockmode) I reach >80 k/s!
No video-editing tricks, just raw video/audio data live from the HD.

Specs:
Audio 6.144 kHz 4 bit
Video 8 fps 64x216 16 grey (4:3)
Data-rating 60 k/s (the maximum with a 6144Hz IRQ busy with audio).

Mr.Atari

OK, consider it given, as the zx81 was released in '81, I assumed the TS1000
was released not long after the british counterpart.
The only difference between the two machines was the TS had 2K of RAM rather
than 1K.

I don't have any sales figures, but do think quite a few TS1000's were sold in the US. They were *cheap* and a lot of people bought one just to see what it was like.

Some of those people were completely turned off on the idea of a home computer by the cheap little Timex/Sinclair. They just threw it in the trash and didn't fool around with another computer until years later when the computer industry had matured quite a bit.

Others found that they liked tinkering with computers, and/or BASIC, but were very disappointed by the lack of capabilities found in the little TS1000. So, they went out and bought another computer. Having been once burned, however, they were not about to buy anything with the name Timex, or the name Sinclair , on it.

Some of them bought a Commodore, some an Atari, and others an IBM Clone. They also told their friends, relatives, and co-workers about their horrible experience with the TS1000. Even if Sinclair had tried to get into the US market, they were dead in the water, even before launch. The Timex/Sinclair fiasco had seen to that!

Timex, on the other hand, saw the handwriting on the wall, and left the computer business before losing a lot of money in it. They returned to their core business of watches and expanded into more closely related areas, such as clocks and clock radios. A field they did quite well in for many years.

The big mistake Timex made with the TS1000 was a marketing mistake. They marketed it as a home computer. A mistake which made the Sinclair name

worthless in the US.

Had they marketed the TS1000 as they should have, as an educational toy, I see two things that might have happened.

1. They might have been able to sell computers based on the Spectrum line, and remained in the computer business until the end of the 8-bit age.

2. The Sinclair name would not have suffered as it did. Instead of being worthless, the Sinclair name might be right up there with Commodore and Atari.

BTW, the TS1000 may have even hurt Timex in their core business. At about the same period of time Timex went from being the number one purveyor of wrist watches in the US to about number three or four. Speaking for myself, up to that time, I had worn Timex watches since the late 1950's. For about ten years I wore Casio watches instead, as the name Timex carried with it the stench of CHEAP rubbish. I have forgiven Timex for the TS1000 though. Once again, I use Timex watches.

However, the Sinclair name is still one of low esteem in the US. Clive can thank the TS1000 for that!

The C64 is from 1982 and the Spectrum + from 1984. I tried to be nice by
giving Sinclair a couple of years to catch up to the C64... but it is obvious
that he was unable to do so.

If we start counting after-market add ons, we might as well add hard drives
for the C64. And, battery backed, 16 megabyte, RAM drives, with a real time
clock. ;-)

Even worse! A membrane keyboard with no _real_ keys. Have you ever tried to work with even the most rudimentary inventory program on such a keyboard? If you have, and if you _liked_ it, you might be a masochist.

Besides, if you got up to answer the phone, and if you bumped the table leg with your knee getting up, the damn thing crashed!

> Because it didn't do colour (after all, it was only a zx81, not a spectrum)

Being kin to a ZX81, perhaps it condemned itself. I hear a voice booming, "ZX81, go and be used as a doorstop, oh incompetent one.

>> Personally I prefer the Atari 8-bits (and started out on a Atari 400)
>
> Ahhhhh, you mean the one with the flat keyboard... um...

At least it had real keys, I suppose.

You mean to give the C64 an artificial head start.
Spectrum: released april 1982. No amount of hand waving or trying to make it
a spectrum + will change that. There WAS no difference between the spectrum
and + as mentioned earlier. The next hardware change in the spectrum line
was in 85 with the 128.

If I remember correctly Commodore released a 256 Kb RAM cartridge in '83, and later a 512 Kb RAM expansion cartridge. The 16 meg RAM expansion came several years later from a third party vendor.

Memotech released 256 and 512k memory expansions *FOR THE ZX81*

What format is the video in on the Hard Drive? Is it already in the 64x216
16 grey? How did you get it into that format?

>

The movie is converted by TMPGEnc to the 64x216 format as a
uncompressed AVI. The AVI then is read by the Atari and frames
(BMP-files) are converted to Atari-images, saved as a 'movie-file'.
Audio is saved by TMPGEnc to 16 bit mono and shaped, modified and
saved as 8 bit by GOLDWAVE. The Atari then reads / converts this to 4
bit, saving as a 'audio-file'. Both Atari-files are then stored for
use with SIO2PC. (This part is done on the PC and the Atari is infact
the emulator).

On a real Atari: Audio and Video at a frame-rate of 8 fps are then
sandwiched together and saved to the HD as a raw audio/video-stream.
Uploading a movie of 1.5 hours (about 250Mb data) takes 24 hours using
3xSIO speed (11 Mb/hour).

The player is a relative short program that loads the audio and video
packets in a buffer, plays the audio part and shows the corresponding
picture. This way I'm sure audio and video are in sync ;-)
I use IDE block-mode to read the packets, reaching the extremely high
speed needed to play the video (60 kbyte/s). Sound is played using a
IRQ that sends audio-data to the POKEY soundchip.

You must think that I'm crazy, but it's nice to show what a 'old'
computer can do with todays technology (IDE-port).

Current movies on my 800XL are:
TRON
StarWars IV
Black Hole

Greetings!
Mr.Atari.

While TV Services of Cambridge (who still exist) used to fit a 4MB RAM
expansions system to the Spectrum, with an altered multi-tasking BASIC,
called the XK System.

Keep in mind though that a VGA monitor is so much higher quality than an
atari 8bit is able to produce that things may look a little weird. For
instance even in 320x200 res the pixels will look blocky. And I'm not
sure that 320x200 artifacting will work on a VGA monitor.

> jeremy
I would think from my roughly 21 years experience with computers that it would be impossible to fix them from the images. I would think that occured when reading the original disks. You might try converting those images again. If they still have errors I would try converting them using a different disk drive as it may be able to read the data from that section whereas the one you used originally could not.

Thats all I can think of without getting too exotic.

One idea I've had is just adding a second primitive computer you could give routines to. I have a few samples of some National Cop8 microcontrollers that can run at 20 Mhz and if I'm not mistaken (I haven't taken the time to read the datasheet yet) they are very close architecturely to the 6502. A hack to have that run some processor intensive routines on could be interesting.

Yes, the 16MB C64 cartridge is out ... only the 256KB and 512KB RAM
expansion cartridges count. What was the maximum expansion of the
Spectrum by whichever company it is that produced this "mythical"
machine (in the sense of storied in myth and legend, not in the sense
of being imaginary since, although I have never personally seen one or
met anyone who has had one, I do believe that they once existed).

It could be done w/o much more then programming effort and a SIO2PC cable.

Just add another command to the SIO buss that causes the IBM to execute
an extended or complex operation and returns the results.

I don't think math complexity or intensity of calculations is a problem
though. For instance you could probably have the IBM calculate a fractal
and return a full 8k screen worth of data at 56k on the SIO buss in less
then 10 seconds instead of the 1-9 hours an Atari may take. Problem is
you end up with a fractal landscape<or whatever> on an Atari which isn't
exactly in high demand. It is a solution in search of a problem if you
get my meaning.

Even if you do get a killer app, lets say an Eliza type parser that plays a game of chess while carrying on a conversation, you still have to deal with things like "Should I use my Atari 400 with membrane keyboard or my Dell to interact with it?"

Well,
are all/some of the mentioned movies available as 16MB SIO2PC images ?!?
Would like to download and add them to my "Atari 8bit Movies"
collection. I already have the Yar`s Revenge and 3SAT movies as well as
some demos from Poland that are very movie-like (Madteam demos Bill-Pie,
Killer-Whales, Comet, X-Demo, Journey, etc. as well as some quite old
Movie-Maker/*.MVM files).

alas, the 3Sat movie by Mirko Sobe has some bugs/errors, it uses more
than 3 boot sectors and as a result the VTOC and DIR sectors also do not
appear where they should, so SIO2PC or MyDOS under SIO2PC cannot read
this 16MB image (it shows no directory and reports 000 free sectors).
Maybe you can repair this (since I have not found any repair tools for
16MB images yet and all the sectors and data seem to be there)...
greetings, Andreas.

I'd have agreed with you before I found this card (no brand):

Input: Composite Video + Audio, S-Video, YUV, VGA
Output: Composite Video + Audio, S-Video, VGA

I bought it in order to save space in my room (no more need for a
TV!), and it works great with my Atari 800 and my Jaguar on my Sony
17" LCD (SDM HX-73). The card has an on-screen menu which allows you
to set brightness, contrast, color and volume. It handles PAL/NTSC
signals flawlessly.
The great thing about it is that it is a stand-alone card and you
don't need a PC in order to use it, which is very nice if you want to
watch a DVD or a video tape in peace (no fan, no hard disk spinning).

I consider the results really excellent, and (more important!) much
better than I had expected. I found the card second hand and I think I
paid 30 euros for it...

I'd be happy if I could connect my Atari 400 to it... any ideas?

Ciao,
gianfranco

Of course then why write any program for the atari. I was thinking of
building into it some basic program building blocks in the cop8. For
example the chip I have costs $12 Canadian at www.digikey.ca and is a 20
Mhz computer with 32k rom and 1k ram. The rom is flash memory that can
be reprogrammed 100,000 times so you could put in there standard
building blocks for programs. IE fast math routines including floating
point with can get kinda crazy using a 6502. Also how about zip type
compression 3d manipulation routines etc. And if its directly
interfaced to the 6502 than it will be able to transfer data back and
forth much faster than 56k.

I have seen the movie player before since you mentioned it on the Atari hangout practically since the start. Just awesome. Almost surreal to see it do that.

Seeing TRON on the Atari 800 would be worth the 36 hour upload time. :)

Some commercial software used to move the directory sectors to another location on the disk. In this case, viewing the directory of these disks would give you garbage, or some clever message the programmers put in the proper directory sectors.

It sounds like these are data disks though and errors were probably introduced into the images.

Continuing the theme....

Which Atari 8-bit emulator is considered the "best" available today on Linux?

I'm looking at something that can substitute for my 800XL for development. -- I use the Newell Ramrod XL OS, Mac/65, and it has 256K RAM (192K MyDOS RAMdisk). The emulator would have to support alternate OS ROM images, the OSS supercartridge, and bank switching RAM.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I'm not sure I need the Atari to be made into a different type of tool.

I do all my zip stuff on my Windoze computer and use an SIO2PC cable to get it to the Atari. This is kind of what I mean about a killer app. The applicationns you use as examples are already done and running on giga Hz Intel boxes. By ~definition a killer app is something that you buy a box to run because it is so valuble/necessary.

Just as a for instance, if you could hook up a network card or 56k modem to the Atari after the mod, then it would have value in that it performs something you otherwise can't do and eliminates the need for a PC gateway.

I'm hoping to exhibit Atari stuff at the Vintage Computer Festival again
this year. This would definitely be a trip to show off!

Bob, you out there? Can we cram some huge CF card into that 1200XL of yours
and play a video off it, like this? >:^)

Hello Andreas!

At the JHV-2004, there will be a nice presentation of the viewer :-)

The files are 250 Mb for 90 minutes of video, so too large for SIO2PC
to handle. If you want I can burn some MOV and RAW files on CD, for
you to have.

For anybody with a MyIDE-drive, I have uploaded the 2 min. commercial
"What we come up next" on my homepage. Instructions how to upload to
your Atari are all there. Remarks / questions are most welcome.
www.mr-atari.com/demo

The 16 Mb image from Mirco is here:
www.mr-atari.com/docs
It playes OK, perhaps he fixed it?

Cheers,
Mr.Atari

No... I've read it, although it's been a while, and it hit me. But by then
it was too late.

Hrm, any way to use this on an emulator (like Atari800 under Linux)...
just to see?

(I'm honestly not familiar with MyIDE, so dunno if I can 'simulate it'
with a big ATR disk image in the emu.)

thx

MyIDE is a hardware expension for the XL/XE-computer for connecting IDE devices (like Hard drives / CF-card) to your 8 bit machine. It's parrallel, so extremely fast compared to SIO. I'm the creator of MyIDE. It's all freeware and schematics, software and instructions are on my homepage. I made 2 productions (whe first sold out in a few month!) of 60 each and are selling them for people who are not able to make the interface themself.

Anyhow,
I do not thing there is a emulator out there that supports this.....
yet....

I saw your question about TRON. If you like I can burn the .MOV and .RAW file on a CD and send them to you. For the demonstration you need a 8 bit machine with MyIDE and a (FAST) IDE drive and some software.
sijmen@mr-atari.com

Kind regards,
Sijmen.

Can anyone point me to documents, notes, etc. which might
describe how Galaxian manages to get
so many independent players per row? Is there a forum for
discussions of this sort?

Thanks.

> describe how Galaxian manages to get
> so many independent players per row? Is there a forum for
> discussions of this sort?

Well, I would say you've found the right forum.

Not all you see in this game are players, actually. The game
uses mostly a line-synchronized kernel routine that alters
the horizontal position of some players (thus, cuts them
vertically) plus combines this with playfield graphics (Antic E)
with vertical/horizontal scrolling enabled. The 'tricky' part
is to replace the playfield graphics with similar looking
players so you don't see what is what.

So long,
Thomas

Thanks, I knew it was complicated. But even if I completely
understand your explanation(?), I don't see how
collision detection is done.

Hi Sijmen,

with the right device handler would it be possible to load these file
from a cd-rom drive as well?
So distribution of these hughe files would be easier.

Regards
Frank

Collision detection is not always done using the registers....x and y
coordinates could be compared to see if a collision has taken place.

This doesn't describe exactly how it is done, but describes the
principles behind it:

It looked real good when I showed the clip at my local Atari
meeting on my Atari Hades. For some reason it always quits in the
middle and Aniplay tells me the file is not a MPEG file. Can't
hear the sound either, but I am thinking the file is not 100%
totally compatible with my player. Still, good job.

If you use an XL or XE, a monitor cable from Commodore and a video
converter you can hook your Atari 8-bit up to any SVGA monitor and
get wonderful color.

Hi Frank!

Unfortunately MyIDE handles 8 bit only.... Since a CD-player
uses ATAPI-standard 16 bit data packets are needed to transfer
data. I'm still working on a 16 bit version of the MyIDE-interface,
but i'm not getting anywere yet.......

Perhaps in future, you can play a kind of VCD on your Atari XL/XE.
Would be nice :-)
Let see what time brings.

See ya,
Mr.Atari (sijmen@mr-atari.com)

Perhaps a corrupt download? Maybe check MD5 sums (Mr. Atari? :))

FYI, the video played fine on my wife's Linux laptop using mplayer.

Once upon a time, I remember seeing a disk that had a shortened runtime-only version of Basic A+. IIRC, it was on a tax program disk or something similar. Does anyone else recall this?

Incidently, I also found what appeared to be a shortened version of the the Basic XL runtime interpreter on another disk, but this isn't the same thing as the Basic A+ version.

Larry

Is there a chance you could give some more specs/pictures
(outside/inside) of the card in question? Something that would give a
good hint what to look for?

2830. Attach Atari 800XL to All In Wonder card?

Newsgroup: comp.sys.atari.8bit
Date: 2004-07-26 23:44:20 UTC
From: Richard Forester <"richard_ forester"@msn.com>
Message-ID: <41059755$1_2@127.0.0.1>
Source record: 14937

Has anyone been successful at connected their 8-bit machine to ATI All In Wonder card on their PC? I am trying using the typical connectors for a TV to the back of the AIW card's coax connector without any luck. The TV application is set to the proper channel and to "antenna" (not cable tv). I am guessing that the signal the Atari generates is just too weak for the tuner card or that this is just something that cannot be done.

Any help is appreciated.

Thanks!

Ive done it. You cannot hook it to the Coax(F conector). You need to
hook it to the Video in which is the yellow RCA connector on the input
side of the card. My card had a input and output cables. It does work

Could you elaborate on your setup a little more? I have tried both the coax
and the composite video in (yellow) connector and have had no luck with
either of my Atari 800XLs. I am using an ATI All In Wonder 9800 Pro with
version 9.1 MMC TV app as my video card/application. I have tried these
scenarios:

Atari supplied RF cable + TV/Computer Switchbox + ATI coax input (Channels 2
and 3 checked) - I can get a faint rolling screen in this scenario
SuperNintendo RF cable + ATI coax input (Channels 2 and 3 checked) - Nothing
Atari supplied RF cable + ATI composite (yellow) input - Nothing
Monster Cable Video cable + ATI composite (yellow) input - Nothing

Hi Richard-

I've done this for several years with two different AIW cards (128 Pro and 9000). Works perfectly. Haven't used the 9800.
I've used MMC 8.1 and 9.1 successfully and have used both with composite and S-Video input. For my system, 8.1 works better, overall. Doesn't work with the XEP80, because ATI says it needs the color burst to sync on. I use both 130XE's and 800 XL's (stock and with video mods).

Does the 9800 accept component video? I have noticed that fewer new devices seem to accept the signal from an Atari, so they may have updated something in the 9800 series.

Have you tried setting the MMC setup input to "cable" instead of "antenna"?
What kind of Atari video cable are you using (not the RF)? You mentioned a "Monster Cable" -- what did you connect it to on the Atari?
Regardless of what ATI has done, it still should work with an RF cable. Have you tried inputs from any other devices (VCR, DVD, etc.) Any error messages?
Did you do the "channel scan" in the software?
Let us know how this goes -- and good luck!
Larry White

2834. Atari 400/800 VSYNC

Newsgroup: comp.sys.atari.8bit

Thanks. Apparently VSYNC is generated by the ANTIC chip and output
as a logic combination
of the ANx lines to the GTIA chip. Also it evidently always occurs
on the same scanline. I wonder
how VBLANK is determined, since it starts before VSYNC?

2837. Offtopic - I seem to have wiped my USB key (PC)

Newsgroup: comp.sys.atari.8bit
Date: 2004-07-27 21:47:07 UTC
From: Music Shop Landgraaf <landgraaf.musicshop@hccnet.nl>
Message-ID: <4106cd5f$0$766$3a628fcd@reader10.nntp.hccnet.nl>
Source record: 14944

Howdy folks

This is totally off topic, but I hope you guys can help.

I bought two USB keys, 128 MB each. Lexar JumpDrive Sport.

I read in all these magazines that you shouldn't remove them from the PC as long as the LED if flashing. Wel, the LED keeps flashing slowly. So I right clicked (Windows XP Professional) on one of them (removable drive, the PC tells me they are), and selected "uitwerpen" which means "Eject". Now all the data is gone. How do I get my files back. It's my email that's on there.

CU Mathy van Nisselroy

PS since the keys don't really fit easily into the computer, I'm using a USB hub. One of those that come with a cable and a power supply. "Medion" sold by "Aldi" in the Netherlands.

From: Richard Forester <"richard_ forester"@msn.com>
Message-ID: <4107138d$1_1@127.0.0.1>
Source record: 14945

Hi Larry. Thanks for your comments.

I tried again today and found that I was able to get a signal from one of my Atari 800XLs to another PC I have that has an ATI All In Wonder Radeon (the orginal Radeon). I was using MMC 7.7.0.1 and it was pretty clear except for the usual noise you would see when connecting directly to the coax. As before, the other 800XL failed this test as well. I was also unable to get a signal using the composite input on the AIW Radeon with both Ataris.

So, it seems there are a few things in play here... One is that not all Atari 800XLs are created equal. A look at the bottom of these two show very different serial numbers, completely different manufacturing stickers. Two, there may be a difference in the way that the original Radeon cards handled signals than the more current ones (like my AIW 9800 Pro). I say may be because this might be a function of the MMC. I am using 7.7.0.1 on my older system and 9.1 on my newer system. With the newer system I cannot get either Atari computers on the screen no matter what I do.

In reference to your questions, yes I've tried "cable" vs "antenna" in MMC and neither works. I only have the Atari video cable (RF cable) and a video cable made by Monster Cables. I was trying the Monster cable because it was specifically designed to carry video signals. No difference there (it has RCA plugs on both ends like the Atari RF cable). Other devices seem to work just fine on both ATI cards. I can hook up my old Super Nintendo just fine using either the coax connector or composite input. There are no error messages. Yes, I did do a rescan of the channels in the MMC application.

Whew....

I think I will just have to wait it out and take these computers to my parents house when I see them next month. They have several TV sets to hook the Ataris up to and I have none (very long story). At least I will see if both Atari 800XLs are working properly.

Thanks,
Richard

They look like HDs to the PC so any HD fixing software ought to work OK.
Norton is the obvious one but there are a few free or shareware progs
about for uneraseing files or recovering from corrupt disks.

It looks like you may not be using a proper composite cable for the computer. You need to have, I think, a 5 pin DIN connector to the composite monitor port, with RCA plugs on the other end. You'd only be interested in the composite and sound wires.
Those cables are a little hard to find, maybe e-bay. Hmmm... seems like the power adapter is an identical 5 pin DIN, or maybe I'm not remembering right, ie. you could accidentally plug the power into the monitor, I must be wrong.

Of course I can try to send pictures of the outside. For the inside,
if you really want them you have to be patient, as I'm quite busy
these days (my girlfriend is moving in and a lot of work has to be
done!).

Please send a reminder if you don't receive them by next tuesday (I'll
be away until next sunday, and I'm likely to forget about it
afterwards...)

You're doing it all wrong. Forget the RF cable, the TV switchbox and all that.
Forget about monster cables, and setting the AIW's input to "cable" or
"antenna". What you need is a special composite video cable to hook it to the
800XL's monitor output (not the TV output). That cable has to have a 5-pin DIN
connector on one end, and 4 RCA plugs on the other end. Usually, these will be
colored red, white, yellow and black, when connecting it to the 800XL you have
to find out which one is carrying composite video, mono audio, luma and chroma
(the four signals that should be present at the 800XL's monitor jack [*]), and
connect the audio and composite video to your PC's inputs. And set your source
to "video" or "composite", whatever it's called in the MMC (can't remember right
now).

[*] actually, unmodified 800XLs are lacking chroma output, as the corresponding
pin isn't connected as it should be

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> are they Mac or PC only?

I have an HP Deskjet500plus that I use with an Epson FX80 emulation cartridge.
Have to use legal paper with it though.
I have a driver I made for Paperclip 3.0 that uses its HP codes. Problem is
that it can easily take 10 commands to do one setup, so
most A8 software will not work.
I have also used a HP LJII by setting the front panel features then just dumping
to P:. Not good for GFX.
I seem to recall doing the same with my HP LJ6L. One was is creating a setup
with the PC, printing it to
disk, and transferring to the A8 as a dump file.

I use my Canon BJ4100 since it uderstands most Epson codes, but again, legal
paper.

I have several new printers I am looking for control code manuals so I can play
with them, but the data formatting will be a nightmare!

Slow flashing is probably O.K. It is on mine. Fast flashing is a read/write
indicator.
But it depends on the drive. There will be a difference particularly when a
copy or delete action is going on.

Eject should have worked fine. Though I never use it. Was there a source for
the email files?
Maybe its still there.

Reasonable Price? Don't know. Cut a cable up is the cheapest.
Best Electronics and B&C are probably the current places to look.
I stopped depending on plug/socket availability years ago. I pick up
cables/extra
hardware whenever I find them.

There is a common version of Space Invaders for the Atari
400/800 which has the invaders
appearing onscreen by descending from above. But I recall
another, similar, version which
had the invaders appearing from a rocket on the left of the
screen. Does anyone know what
this version was called?--or where to find it?

> Maybe its still there.

Tried it again today. It works now. I guess the Eject somehow made the USBkey "disappear". Removing it from the hub didn't help. (remember, I'm using the hub, cause the keys are a wee bit to big to fit nicely into my brothers laptop. I'm gonna get my own computer later this year.) Today, the computer showed me all the files. Maybe the key wasn't physically removed from the computer long enough. I also noticed that the LEDs aren't blinking all the time anymore. Guess that's because I'm not using the hubs power supply, but hoping the computer can deliver enough juice to power both keys and hub. The cable to the power supply is a bit short, and I don't wanna trip over it.

CU Mathy van Nisselroy

PS I've seen (in magazines) photo's of electric toothbrushes and even coffeecups that keep your coffee warm that are powered only by the usb port. If it can power that, then two usbkeys should work too.

I forgot to mention. You can set the Canon BJC4x00 series to different paper sizes by powering it up while keeping one of the two buttons pressed for a while. The printer will beep. All you have to do is release the button aftre the right beep to get the configuration you want. If I don't forget, I'll check it out at home.

Howdy Folks

I just watched Mr.Atari (Sijmen Schouten's) viewer. This is great stuff. Check out his demo at http://mr-atari.com/docs/mra_showing_matrix.mpg (remove that last part to get to the menu and remove everything behind "com" to see the site.)

I asked Sijmen if he was willing to convert his viewer from MyIDE only to ASPI compatible or BlackBox. Unfortunately he doesn't have enough knowledge about hte BlackBox to do so. So now I'm asking everybody: "Can this viewer (sourcecode is included in the VIEWER.ARC - see menu mentioned above) be converted and if yes, who wants to do it?"

You can find information about ASPI on my ASPI page (as long as my site is still up) at http://www-users.rwth-aachen.de/mathy.van_nisselroy/aspi.htm

BTW let me worry about the size of the movie, I'll come up with a way to get that to the Atari, trust me.

Thanks for the responses. I got a private email (thanks)
informing me that Atari originally released a versionof Space
Invaders with the Invaders emerging from a rocket on the left
of the screen and no barriers along
the bottom. A later version, called Atari Invaders, has the
barriers and no rocket on the left. This was
intended to be more like the arcade version of Space Invaders.

Paperclip is my favorite word processor, but I have never been able
to find the 130XE version. It was supposedly on the flip side of the
version 2+ disk. Anyone know where I can find it. I have version
1.0 and the dongle.

Well, of course it depends on what you want to use it for, but
the TS1000 was the first almost completely closet compatible
computer. It was certainly more closet compatible than a C64,
which would be far more likely to be dragged out of the closet
to play games if not for use as a home computer. But after
using the TS1000 to learn a little bit of Basic programming ...
into the closet, no muss, no fuss, no bother.

I would like to take this opportunity to point out the the TS1000 was also
landfill compatible.

It could also be used as a doorstop. It wasn't heavy enough to make a good
doorstop, unless you kicked it a few times to wedge it firmly under the
door... which made it FUN to use as a doorstop! ;-)

The thing is that someone might be tempted to slip it between the door
and the door jamb to use as a door stop, and then it would fail, when
it snapped in two.

However, the 16K RAM which would crash the machine on a whim or a car
pulling out of the house next door always made a good paperweight. It
definitely worked better as a paperweight than as a ram expansion.

Needless to say, my dad bought me the TS1000, I then bought the Ram
expansion, since 2K RAM seemed a bit confining, and my experience with
that and with tape as storage led me to buy the machine with a disk
drive and the most possible RAM included that I could afford ... which
was a Commodore 64 / 1541 combo. I bought it from a place that
advertised it as something like a "84K Home Computer". You see, 64K
RAM, plus 8K kernal makes 72K, plus 8K Basic makes 80K, and then I
think the character roms are where they get the rest.

I guess they would have been proud of me a couple of years later when
I got a WarpSpeed cartridge to make it workable as a word processor
together with The Write Stuff and a daisywheel printer, which would
have pushed it up over 90K.

I have uploaded 3 demos now:
A fly, what we come up next. Atari commercial.
Matrix-reloaded. First 3 minutes of the movie.
SoutPark. "What whould brian boitano do". Video-clip

MyIDE, SIO2PC, ASSEMBLER-EDITOR NEEDED.

Have fun!
Mr.Atari

Well,
with a My-IDE by Mr. Atari (Sijmen Schouten) this is no problem. He and
another MyIDE guy already use 256Megabyte CF cards running via MyIDE...
So, if you know how to install a MyIde into your 1200XL this should
really be no problem... -Andreas.

Hello Sijmen,
maybe you can bring such a CD to the ABBUC JHV in Herten in
October...?!? Thanks - Andreas.

Oh,
if you ever come out with a 16Bit version of My-IDE please reserve one
for me !!
Besides, I like the image option of MyIDE (booting any image with the
STARt key). Alas, the naming of these images is a little bit awkward
(just 3 or 4 numbers), it would be nice if one could use at least up to
8 characters (alpha- and numeric letters). The extender would not be
important then, but the filename - 8 letters make it much easier to
identify a program then just 3 or 4 numbers (especially if you have
uploaded/saved hundreds of images and have to remember which number
stands for which image)... just a thought... greetings, Andreas.

yes, the version you mention was released in cartridge.
very popular game in those years.
and thats right the rocket version was called just "space invaders"

Well, I don't HAVE to use legal, but so much commercial software for the A8 expects to
have a skip top perf margin. With this printer(and other modern printers), there is no need.
There is also usually no way to turn it off, so the page gets split between two letter sheets
because the skip top perf LFs get sent anyway, the bottom has the page eject.

Software where I can change the printer config usually, not always, lets me set skip top perf to 0.

So leaving Legal paper in is just much better. If you just print text where page breaks don't matter,
letter can be used easily.

As another note....

My Canon BJC4100 uses 2 cartridges, a Black, and a tri color. I have been refilling them both for years..
Well four or five time each till they show sinns of not working anymore, then I replace. So I have about
a dozen of each that will last me a decade. But then I bought from ebay, for about $5.00 a pair...may
not bother refilling as much anymore. I also have a couple of the single large black and a couple of
flourescent carts.

Reminds me, I have to shake them a bit.

2898. xX6 Almost FREE MONEY !! xX6

Newsgroup: comp.sys.atari.8bit
Date: 2004-08-04 05:43:11 UTC
From: John Meyer <meyer_j@allthis.net>
Message-ID: <A%9Qc.17195$a%1.6519@fe39.usenetserver.com>
Source record: 14961

MAKE MONEY!!!

MAKE THOUSANDS!!!

I found this on a bulletin board and decided to try it: I don't care about the useless pre-fabricated crap this message usually says. All I say is, it works. Continue pre-fab crap.

WELL GUESS WHAT!!!

Within seven days, I started getting money in the mail!! I was shocked!! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of more than $1000.00!!

Let me tell you how this works and most important, why it works..... also make sure you print this out NOW, so you can get the information off of it, as you will need it. I promise you that if you follow the directions exactly that you will start making more money than you thought possible by doing something
so easy!!

Suggestion: Read this entire message carefully!! (Print it out or download it)

Follow the simple directions and watch the money come in!! It's easy. It's legal. And, your investment is only $6.00 (Plus postage) !!!

You can use any currancy as people can always change it..

IMPORTANT:

This is not a rip-off, it is decent; it's legal; and it is virtually no risk - it really works!! If all the following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE:

Please follow the directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become apart of the Mail Order business.
You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the
mailing lists is secondary to income which is made from people like you and me asking to be included in that list. Here are the four easy steps to

success.

STEP ONE:

Get six separate pieces of paper and write the following on
each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST."
Now get 6 U.S. $1.00 bills and place ONE inside of EACH of the six pieces
of paper so the bill will not be seen through the envelope (to prevent
thievery). Next, place one paper in each of the six envelopes and seal them.
You now should have six sealed envelopes, each with a piece of paper stating
the above phrase, your name and address, and a $1.00 bill. What you are
doing is creating a service.

THIS IS ABSOLUTELY LEGAL!!!!!

You are requesting a legitimate service and you are paying for it!! Like
most of us I was a little skeptical and little worried about the legal
aspects of it all. So I checked it out with the U.S. Post Office
(1-800-238-5355)
and they confirmed that it is indeed legal!!

Mail the six envelopes to the following addresses:

Matthew Dutton
46 Hayworth St
Point Vernon, Hervey Bay
QLD, 4390
Australia

R. Visser
P.O. Box 274
Nobby Beach
QLD, 4218
Australia

S. Phillips
77 Manly Drive
Robina, QLD 4226
Australia

Chris Pittman
7651 Abigail Glen Dr.
Charlotte, NC 28212
USA

Mike Vango
29 Pebblewood Ave
Scarborough, ON M1V-2A7
Canada

C. Wehler
137 Sara Rd
St. Marys, PA 15857
USA

STEP TWO:Now take the #1 name off the list that you see above, move the other names up (six becomes 5, 5 becomes 4, and etc.) and add YOUR NAME as number 6 on the list.

STEP THREE:
Change anything you need to but try to keep this article as close to original as possible. Now post your amended article to at least 200 news groups. : (I think there are close to 24,000 groups) All you need is 200, but
remember, the more you post, the more money you make!! This is perfectly legal!! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal Lottery laws. Keep a copy of these steps for yourself and whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to directions. Look at it this way. If you were of integrity, the program will continue and the money that so many others have received will come your way.

NOTE: You may want to retain every name and address sent to you,> either on a computer or hard copy and keep the notes people send you.
This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft). So, as each post is downloaded and the directions carefully followed, all members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business!!!

*****DIRECTIONS FOR HOW TO POST TO NEWS GROUPS!!!*****

STEP ONE: You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.

STEP TWO:
Open a blank 'notepad' file and place your cursor at the top
of the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into the notepad so that you will add your name to the list.

STEP THREE:
Save your new notepad file as a text file. If you want to do your posting in different settings, you'll always have this file to go back to.

STEP FOUR:
You can use a program like "postXpert" to post to all the newsgroups at once. You can find this program at <<http://www.download.com>>.

Use Netscape or Internet Explorer and try searching for various new groups (on- line forums, message boards, chat sites, discussions.)

STEP FIVE:
Visit message boards and post this article as a new message by
highlighting the text of this letter and selecting paste from the edit menu.
Fill in the subject, this will be the header that everyone sees as they
scroll through the list of postings in a particular group, click the post
message button. You're done.

Congratulations!!!!!!

THAT'S IT!! All you have to do, and It Really works!!!

BEST WISHES ...

ouYj\

2901. Undocumented opcode: AAX

Newsgroup: comp.sys.atari.8bit
Date: 2004-08-04 15:10:56 UTC
From: "C. Bond" <cbond@ix.netcom.com>
Message-ID: <4110FC8C.DCCD1D56@ix.netcom.com>
Source record: 14958

The information I have gotten for the 'undocumented opcode'
called AAX or SAX,
(A & X) -> M, indicates that this opcode affects the N and
Z flags. My own tests suggest that
the flags are *not* affected, and this instruction behaves
like other store operations.

Has anyone tested this and formed an opinion about its
affect on the flags? I'm confused...

What's the (hex) opcode for this?

As a side remark, some of the "extended" opcodes are not
properly documented as their precise function also depends
on "what's going on at the bus" while they're executed. Thus,
the behaivour may even vary.

Greetings,
Thomas

It comes in various addressing mode flavors, but I tested the
zero page version, opcode $87.
Apparently some undocumented codes are not generally useful,
since they have unknown or
unpredictable dependencies, as you noted. But a few of these
codes appear to be reliable,
and are sometimes used without problems. AAX (or SAX) seems
solid, but as I posted
the flags seem unaffected, contrary to the documents available
on the internet.

Congratulations! Is this your first? Whether is is or isn't,
newborns are always lots of work, and turn your life upsidedown,
but it's worth it, and you'd never want to go back.

<brag>
It's not that big though ;) Our bloke was 11 lbs 3 oz, and
about the same length (Possibly an inch more, I don't remember
exactly). Our girl was about that weight, 8lbs 6 IIRC. :)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> and are sometimes used without problems. AAX (or SAX) seems
> solid, but as I posted
> the flags seem unaffected, contrary to the documents available
> on the internet.

You seem to be right, the flags are also unaffected according to
my own reference. I made a couple of tests back then for the atari++
emulator, found this opcode also reliable, but it doesn't alter the
flags here either. The reason why this opcode works is not because
it goes thru the AND unit of the ALU where it would set the status
flags. Instead, the CPU pushes the A and X register simultaneously
onto the bus, and due to the electrical characteristics of the
corresponding output drivers, the result is the binary AND of both
A and X register, so you shouldn't expect status flags to be set in
any way. Thus "SAX" is just a combined "STA" and "STX", and both
don't affect the status.

So long,
Thomas

Hmmmm.... Funny you should ask about that. I possess a XF551 that is
mofified and has a 3.5 inch mechanism in it. I purchased it from an
retired gentleman about a dozen years ago. It works fine with MyDOS.

Wow, I had no idea. The Space Invaders I grew up with was the 2600 version.
I assumed the Atari 8-bit computer version was more like the arcade, but
now that you mention it, I don't remember there being barriers.

(I think I've played the true arcade version _once_, a few years ago.
How sad, huh? :^))

I always thought that 'Deluxe Invaders' by Roklan Software was the most faithful adaption of Space Invaders for the 8 bit machine.

http://www.rtdos.com/retro_ss.zip

its not much (only first version) but its a start (at least as a conversation piece). looking to add more screen shots (if anyone wants to contribute, I and the retro community would greatly appreciate it I'm sure)....or maybe someone can help me complete my M.E.S.S. bios rom list (where i got most of the screen shots) so that I can work on getting more screen shots of boot screens (see one of my earlier posts).

next version will include the specific systems where each screen shot is from (this one was just for starters).

comments ? contributions ?

2915. Atari 130XE troubles

Newsgroup: comp.sys.atari.8bit
Date: 2004-08-06 11:30:58 UTC
From: Laust Brock-Nannestad <laustbn@diku.dk.invalid>
Message-ID: <cevq5i$6fc$1@news.net.uni-c.dk>
Source record: 14972

Hi all,

I'm a newbie when it comes to the Atari 8-bit line, so bear with me.

I recently made an SIO2PC interface for my XE, single chip version with DSR for serial control. The trial version of APE recognized the cable correctly and at first sight it seemed to work.

Unfortunatly, a lot (most) of the programs I try to load just crash, in a variety of ways (reset to BASIC or colourful random graphics. Spellbound, one of the games I tried, freezes with half the loading pic fine and the lower half random graphics). A few demos did work flawlessly, like the "Drunk Chessboard" demo.

I'm using "MyPicoDos" (nice menu based interface, ideal for someone like me ;-) as the DOS in D1 and then mount the disk image I want to load something off in D2. When I tried this setup (same disk images, emulator set to 130XE) in the Atari800 emulator, it worked fine, so MyPicoDos probably isn't to blame here.

I've tried lowering the SIO speed to 1x in APE, but that doesn't help. Even small programs/demos (8k intros for example) won't run. I might add that the programs that do work, do so consistently, and the ones that fail, do so every time as well.

The built-in memory test seems okay, 2.5 lines of green squares.

When I look inside the Atari, there seems to be two unofficial patch-wires, one running from pin 8 on the 74LS08P to pin 32 on the GTIA and one running from pin 9 and 10 (soldered to both) on the 74LS08P to pin 13 on the 74LS138.

I'm leaning towards the XE being faulty here rather than the SIO2PC interface, any ideas on what might be wrong with it or how I go about diagnosing the problem?

Regards,

Laust

Are you holding down the OPTION key to disable BASIC when you
turn on the computer? Having BASIC enabled will cause most programs
to crash.

Steve

Hi,

> Can you point me to a document which *correctly* explains the
> undocumented opcodes?

Not really. *Sigh*. I wish there would be one. I've seen various on
the net and in magazines, and they're all wrong in one way or another.

And I should of course add this as a disclaimer to my
own guesswork as well. (-; It is likely incomplete and partially
incorrect.

> If not, thanks for the the above anyway...

You're welcome.

So long,
Thomas

I've been using a 3.5" dual drive conversion by CSS for years. It will NOT do 1.44 meg, 720 is the maximum it can handle. If you need 1.44 meg and/or write access to PC disks, on you Atari 8 bit, get a FloppyBoard (plus a BlackBox if you don't already have one of those).

And if you really wanna contact Bob, try the old phone system, he's a busy man.

Try contacting Roland Scholz, he was developing an ISA card adaptor for the PBI. Untill he started having kids, now he seems to be cured of the Atari 8 bit virus.

Howdy Rick

> Reminds me, I have to shake them a bit.

I've heard that one before, there has to be some truth in it. I printed out a lot of old emails a month ago, using WE-CARE cartridges for my Canon BJC 4200, and I'm getting characters that aren't as they used to be. They kinda have these things sticking out. Just like when you wash something that's nice and strait before you wash it, and when the washer is ready, it's fuzzy.

BTW the 4100 manual you can get from the Canon site. I just did a search on google using canon 4200 manual (without these ") and was pointed to the site where I could have downloaded the manual and all kinds of stuff.

If I can find your email address, I'll send you something to read. But it's over 600 kB in size.

CU Mathy van Nisselroy

BTW aren't you the guy that makes these "video and audio convertor" thingies? Do you know if it's possible to connect two monitors to the same video and audio output (stereo sound if possible) from one Atari 8 bit computer using some kind of convertor (with or without it's own power supply)?

2925. 8bit Emulator With PC Speaker Support?

Newsgroup: comp.sys.atari.8bit
Date: 2004-08-07 16:11:19 UTC
From: Daniel Miller <NOSPAMdaclmi@sisna.com>
Message-ID: <ckv9h0hkm4c4o1r6nb7tl3rkt3h6q9qvtb@4ax.com>
Source record: 14982

Does anyone know if any of the DOS Atari 8bit emulators support the PC internal speaker? I have an old 386 and I was considering making an experimental machine that just loads and runs a 8bit emulator. The machine has no soundcard and I would also prefer to avoid dealing with speakers and wires.

2926. Black Atari 850 Interface Module Production Run, Quantity, Rarity ...

There's a program called 'memtest.com'. It tests for extra memory.
Then there's a Newell program to test memory.
An 800 should be easy to determine how much memory it has, about the only
way to put more memory is with memory cards. There were some memory
upgrades for the 800, Axlon?, but still I think you'd have to have the
memory cards. I guess if you have unmarked memory cards, you might not know
how much they were. A stock 800 can have up to 48k memory, I believe.
There isn't hardware for the RAM under the OS, I think. The memtest tests
the memory select bits at PORTB, I think. The Newell isn't very
informative, just tests the banks and reports if they are working, and may
only be for 256k upgrades. I have them both, someplace, I'd have to search.
I WILL search and e-mail them to you, if you have an address here.

Usually that means the on board power supply is going south. 90% of the time it is just the diodes between the big caps on the back of the board have thermal cycled loose and need to be resolder.

> experimental machine that just loads and runs a 8bit emulator. The
> machine has no soundcard and I would also prefer to avoid dealing with
> speakers and wires.

That's actually unlikely to work well, for two reasons: First of all,
the 386 is really a bit too slow for any usable emulation. I would be
astonished if you could get that working.

The second reason is the way how a PC speaker generates sound: It is
more or less the latched/buffered output of a standard timer chip,
allowing just "on" or "off" as its only outputs. There's not much sound
processing you can do there - the CPU had to feed in all the data manually,
and if you've just a 386, it couldn't do much else.)-:

In other words, I believe the answer to your question is "No, there's no
such thing".

So long,
Thomas

2934. atari++ 1.38 ready

Newsgroup: comp.sys.atari.8bit
Date: 2004-08-09 08:51:05 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <cf7dtpnuu2@mamenchi.zrz.TU-Berlin.DE>
Source record: 14991

Hi folks,

a new release of the C++ based Atari 8-bit emulator for Linux and
win32 is ready to download at:

http://www.math.tu-berlin.de/~thor/atari++/

This is only a bug-fix release that corrects all known issues of
the 1.36 and 1.37 release, and thus the next stable release of it.

So, what's fixed here:

- Antic timing (once again), so the Dimension X intro will work again.
- Proper emulation of the SIO sound (got broken in 1.35)
- Emulation of horizontal switching of the CHBASE register of Antic
(new feature)
- In the configure file, added test for the g++-3.4.x compiler series.

So long,
Thomas

You can run an 8bit emulator for DOS on a 386, I've done so before.
I'm not saying the performance is great but it certainly works. On a
fast 386 I'm sure it works acceptably.

>The second reason is the way how a PC speaker generates sound: It is
>more or less the latched/buffered output of a standard timer chip,

There are DOS games that make use of the PC speaker to make very
creative sounds. Check out CHAMP "Pacem" Pac-man game and also their
Centipede. Those run fine on a 386, I did so on Saturday. :)

There is actually a DIVX-supporting video player for DOS that makes
use of the PC-speaker. Of course I'm not saying you get good fidelity,
that's not the case. In the case of DIVX you need more than a 386
certainly but it does validate the concept and Atari 8bit sound might
not be as hard to reproduce this way.

>In other words, I believe the answer to your question is "No, there's no
>such thing".

There may not be but it might also be technically feasible, even on a
386.

Hello,

Actually,a 386-33MHz PC will run PCXformer 3.8 quite well.
I think you could use the PC speaker with PCX 3.8 if you used
Windows 3.1,using SPEAK.EXE as a sound driver. In the past I
have set up MS-DOS machines in this manner,and they would play
.WAV files throughtne PC speaker.Easy to set up and worth a try.

I have an IBM Thinkpad that I set up in WIN98 that on boot up runs
an autoexec.bat file that shows an Atari fuji symbol.JPEG,plays a
.WAV file that says "Welcome to the wonderful world of ATARI!" and
using PCX3.8,goes right to SpartaDos 3.3 main screen! Makes my PC
friends really blink,to see an Atari laptop :)

Good Luck,
Ed

The C=64 and Atari could not afford to be put into the closet as they
cost to much, not to use, so users had to keep using them like it or
not.

> > I would like to take this opportunity to point out the the TS1000 was

> have pushed it up over 90K.

TS1000 = 2KB RAM & 8KB ROM + 64 KB (e.g. Memotech) memory interface +
Quicksilva Hi-Res Board 6KB RAM & 2KB ROM + back plane (or pass
through connector)
= 82KB

or

TS1500 = 16KB RAM & 8KB ROM + 64 KB Audio Computers memory pack +
Dk'tronics Graphics 4KB ROM & 4KB EPROM/RAM (fitted internally)
= 96KB

or as this CSS

1984 QL= 128KB RAM + 48 KB ROM
= 176KB

The ZX printer could produce graphics unlike a daisywheel while floppy
drive interfaces were also available for the TS1000

> Where could you possibly buy any of those [Zeddy Family] machines,
> unless you wanted to jump in a jet and go off to pommie-land to pick one
> up in a rummage sale?

Have you tried mail order, theres eBay and a number of Retro traders.
Zebra System in the USA and their distributes worldwide e.g. "ZX81 Kits"
sell them new. Or put a wanted ad on CSS. While a ZX81 clone was made
in the Far East.

I don't think the SAMs manuals/picts are on the net. The two diodes will
be fairly obvious, something like:

```
BACK
**************
* *
* CAP *
* diodes CAP *
* CAP *
* xxxxxxxx *
* x tin x *
* xcover x *
* xxxxxxxx *
* *
* *
**************
FRONT
```

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I'll finally be making it out to CGE again this year. Most
years it runs the same time as another event I go to (that's
THIS weekend this year), but this year they're on different
weekends, so I'm there!

I need to replace the physical key components on an 800XL and am hoping that someone out there might have either a dead keyboard complete or from which they would be willing to extract a few of the needed keys, or a dead 600xl/800xl/1200 system that they would sell or ship for a reasonable cost.

2952. UK: unsold XL/XE stock?

Newsgroup: comp.sys.atari.8bit
Date: 2004-08-13 21:55:56 UTC
From: Gareth <hotmail.com@dgareth.spm>
Message-ID: <411d38b0$0$72821$ed2e19e4@ptn-nntp-reader04.plus.net>
Source record: 14859

Just a quick question that I'm sure "someone, somewhere" will be able to answer.

Atari Corp had a big sales thrust in the mid/late 80s/early 90s in the UK and the Atari 600/800XL did pretty well out of it - even the 130XE didn't do too bad (getting in to mainstream High St shops like Satan's yeast infection DSG).

What strikes me though is that there must have been large amounts of unsold stock - the range surely did never repay all the financial faith the Tramiel's placed it in?

Does anyone know what happened to the XL/XE hardware surplus stock? Are there any 800XLs/130XEs lurking, factory sealed, out there somewhere?

Gareth.

Thanks - that's a site with an interesting list of items for sale.

Still, I wonder what happened to the unsold UK stock of, say, 130XEs - I
know that DSG (a big and to be avoided at all costs UK retail train) had
hundreds of the things which they never managed to sell.

Gareth.

I have no direct knowledge of what Atari was doing at the time but
standard promotions allow for return of inventory for credit so
retailers will take a no cost but floor space chance on an item.

Sure, I just wonder what Atari did with the hundreds of unsold units - and
for that matter unsold Falcons as well. I guess I'll never know.

Gareth.

2958. Atari ++ Inverse Key

Newsgroup: comp.sys.atari.8bit
Date: 2004-08-16 06:37:52 UTC
From: RoyE <r-dean@charter.net>
Message-ID: <10i0lhvte7knnd5@corp.supernews.com>
Source record: 14865

I have a basic program that I use, for my personal use with an emulator. I use the print to file option and then print the results to my PC printer. Atari800win 4.0 has broken this ability because it translates hex &0A to a line feed. And using Atari++ I can't seem to find the keyboard translation for the Inverse key.

RoyE

The inverse key for Atari++ is just the "Alt" (aka "Alternate", "Meta")
on your keyboard. Handling of EOL->EOF conversions can be found in the
menu (though I would believe that you've found this option already).

So long,
Thomas

A lot of times, a company will just keep the old stock and stick it in some old dusty warehouse since on the books, it still has value (an atari 130xe was how much when it was new? 199 dollars? 299 dollars?). So in some sense, its worth it for a company to keep its inventory of 20000 130xe's that they paid 150 dollars for and keep them on the books as assets rather than sell them off for half what they were new.

Now I doubt that they would still be keeping NOS from 1987 stil in their inventory, but in the early 90's, they might have kept them in the warehouse just to show assets on their books.

They probably eventually got sick of having them in the warehouse and eventually just sold them off to some wholesaler who dumped them on the market back in the early to mid 90's.

I think myatari has large amonts of NOS from the actual atari company, not necessarly from retailers who just couldn't unload their stock.

2961. Atari 800 S-video

Newsgroup: comp.sys.atari.8bit
Date: 2004-08-17 16:49:13 UTC
From: Slor <slor@comcast.net>
Message-ID: <Xns9548783E2364Fslorcomcastnet@130.133.1.4>
Source record: 14868

I recently added an 800 to my 8-bit collection, and I have a question or two about the video signal. If I hook up the composite video signal, my video display looks pretty much the same as my other machines. However, when I hook up the chroma/luma signal, the display colors seem ok while the brightness is quite high (kinda washed out with black background showing as a medium/light grey). Is there any way to adjust that? I didn't see any externally accessible pot to turn, so perhaps it has to be adjusted internally. I could adjust the monitor, but then my other machines that share it would look like crap. At any rate, any suggestions would be appreciated.

A second question - perhaps more of an opinion poll... Which of the 8-bit line came with the highest quality built-in chroma/luma signal? My 130 XE and 800 both look pretty sharp (except for above issue), and all I did on my 800xl was connect the existing lines - so its output isn't quite as good. At this point, I'm not looking to do any extensive supervideo mods or anything, so I was wondering which machine is generally considered to contain the best signal.

Thanks!

IMO, the XEGS has the best video composite signal -- really clear when
connected to a Hitachi 57" HDTV. I compared it to the 800 and 1200 XL
composite outs only. Don't have a 130XE.

But there must have been hundreds of them - they just vanished and were
never seen nor heard of again ;-)

My suspicion is that these PAL machines never were sold. The UK market was
well and truly dominated by the C64 and Amiga during the early 90s (after a
promising but unsustained start by the ST) so the XL/XE computers never
would have found an outlet.

Gareth.

Hi SoM. I think the poll question was which Atari 8bit had the best
stock super video (chroma/luma) output. He had mentioned the 800XL,
but that actually has no separated chroma and luma in stock config.
One of the many mods has to be done to get that on an 800XL.

But anyway, since you brought up the composite video signal, maybe
that can be a 2nd poll question. Which has the best COMPOSITE video
signal? You've started us off with your vote for the XEGS.

Hi!!!

Well I can't tell, got Atari some of them, C64/Amiga, Sinclair Spectrum
and QL, SpectraVideo SVI 728, ABC-80 and ABC-806, Apple II europlus.

Send me a Oric, when can I tell if it any differents.

Regards

M.Lj

Well,
1) they were sold by fire (you may know that in the 90s a few Atari warehouses burnded down), and since Atari had a good insurance (which payed the loss) - it was as if they had been sold (for a small joke: how did atari sell 3 complete warehouses full of Jaguars, XL`s, XE`s, ST`s, etc. in a few hours? answer: they burned them!). 2) A second guess: there is a rumour that Atari had once (in the 80s) digged in thousands of unsold ET and other carts (with trucks and ...) in a mexican desert - maybe the unsold Jaguars, ST`s, XL`s and XE`s went the same way... Maybe we should all get our shovel and un-dig the complete mexican desert (that would be a cool entry for "Guiness - Book of Records")... -Andreas.

P.S.: But maybe they are still there and someone is waiting for a good time to sell them (I know that some german and british firms bought complete Atari warehouses, maybe they still have the XL and XE computers but don`t know what to do with them nor how or whom to sell them)...

The stock config does have the lines internally, but they're not connected
to the monitor jack. So, the s-video from my 800XL is simply 2 wire
jumpers to he monitor jack. It obviously is not the highest quality, but
it is certainly improved over the stock composite output. I'd probably do
a supervideo if I wasn't so lazy and didn't already have 5 mods running
around in there. :)

I've looked and I don't think that there's any evidence for this - in the UK
at least.

The question still remains - where do old and unsold computers go? Suspicion
is that there are even a few Vic 20s, unsold Tangerines and Oric 1s out
there somewhere ;-)

Gareth.

Hello All,

I have recently put 10 Atari 8-bit SCART cables as a buy-it-now on eBay for the bargain price of GBP2.99 each. These 1.5m cables are made from a new batch of double screened cable, and are superb! The link to the item is:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=8125881148

2974. BlackBox questionair: (how do you use your BB)

Newsgroup: comp.sys.atari.8bit
Date: 2004-08-19 21:03:24 UTC
From: Music Shop Landgraaf <landgraaf.musicshop@hccnet.nl>
Message-ID: <412515a7$0$146$3a628fcd@reader1.nntp.hccnet.nl>
Source record: 14881

Howdy Folks

I was just wondering how people use their BlackBoxes, so here's a little questionair. (I'm just curious)

1) Do you own a Blackbox? (if No, sorry, please don"t answer this questionair)
2) Do you have a FloppyBoard?
3) Is the FloppyBoard installed?
4) How many SCSI devices are connected to your BlackBox?
5) Which ID's are used?
6) If you have a FloppyBoard and it's installed:
6a) how many drives are connected?
6b) what kind of drives are these? (5.25", 3.5", size?, DS?)
6c) are these visible in the drive configuration page (Option A from the menu)
6d) what drivenumbers are they assigned to?
6e) is UltraSpeed enabled (in the menu) for these drives?
7) do you have SIO drive connected to your computer?
7a) how many drives are connected?
7b) are these visible in the drive configuration page (Option A from the menu)
7c) what drivenumbers are they assigned to?
7d) is UltraSpeed enabled (in the menu) for these drives?
8) What are you settings in Option B from the BlackBox menu?
9) If you have not installed a FloppyBoard, do you have the BlackBox Enhancer installed?
10) does your BlackBox have a BlackBox Printer Spooler installed?
11) does your BlackBox have a Parity PAL or other upgrade to add parity to the SCSI bus?

Where I say: "what drivenumbers are they assigned to?" I mean what drivenumber do they respond to. For instance, I have two 1.44 meg drives as D3: and D4: D5: usually is a partition, but I have my system setup so that it can become either SIO drive 1 or FloppyDrive number 3.

Yup ABC is a Swedish computer.

ABC-80 came in 1978 I will think, a sorts of clone to TRS-80. ABC-80 is
in b/w.
ABC-800 can show colors.
ABC-802 can not.
ABC-806 can show colors.
ABC-16 was a step to the UNIX world.

Then did Nokia bought the Luxors computer department, and is now ICL as
we know.

Btw I have looked at your page, kinda graphic stuff where.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Do you know if there is an adpater to convert from SCART to Japanese RGB?
They use the same type of connector, the wiring is a bit different. Or could
you create a new cable with the correct wiring for Japanese RGB instead of
SCART?

Here is the pinout of the Japanese version :

http://www.gamesx.com/avpinouts/rgb21pinj.htm

The reason is there is an RGB to VGA converter called the XRGB2-Plus that
produces excellent picture, and would be nice to use with my Atari 800....

I really wanted to make it, especially now that it is being held much closer to where I live, but alas, I'm stuck in the middle of a strategy guide project. I did attend World of Atari (98) and the first four CGE's in Las Vegas, but now I've missed two in a row (last year I was on vacation with my family). Have fun, and don't tell me what I missed...I'm still bummed that Nolan Bushnell finally decided to appear the one time I didn't go. :(

All ABC computers got Zilog Z80 CPU inside.

With some cards I think you can fit a harddrive to an ABC-80, but the ABC-800 models can have harddrive with a card. Otherwise did Luxor use their own things, they had did radio, taperecorders and TV's since they started.

The ABC-80 and other ABC models are some in kind for them self, but in some way like Apple I or][, but the Apple development did go faster and longer.

Some technicians from Luxor had been in USA and had seen the Radioshack TRS-80, and then they came home to Sweden, they did talk about a question, can we made a computer?

And, yes they could.

Some years ago, I heard a usergroup here in Sweden had made a basic program in ABC-806 to show HTML pages, but not pictures, but links worked.

The ABC-806 could be used as a "datavisionterminal" in color.

And it got 8 RGB colors and ABC NET.

Just a short breif in the manuals...to give a hint of the ABC-806
computer.

Which type ? I'm prepared to swap an Oric for one of those in working
condition.

> But an Oric is some betveen Sinclair ZX Spectrum and Commodore 64.

Technically perhaps. It looks better and was cheaper. Machines like the Oric
were largely responsible for the price war that ultimately killed them off.

2984. NTSC carts on PAL system - myths?

Newsgroup: comp.sys.atari.8bit
Date: 2004-08-20 20:30:47 UTC
From: Gareth <hotmail.com@dgareth.spm>
Message-ID: <41265f6a$0$929$ed2619ec@ptn-nntp-reader03.plus.net>
Source record: 14891

So it seems that NTSC carts do work on PAL Atari XL systems - the NTSC DKong cart I see in front of me is identical to my PAL cart in every way (even down to the serial number). Needless to say it works perfectly without any issues at all. Actually if you think about it it's almost obvious that it will work - it's basically just software on a chip.

The advice from Ingersoll, when the 400/800 first came to the UK, was that using NTSC carts would/could seriously damage the computer which, in those days, was an expensive bit of kit. The advice was often given in the monthly "Atari Owners Club" newsletters (which were actually very bloody good - shame I chucked mine out because they are definitely collectors items now.)Atari gave the same advice when they took over UK distribution of 400/800 hardware and software.

The advice seems to have been crap and, of course, the NTSC carts were much cheaper than the PAL counterparts. I paid £34 for an Atari 800 Space Invaders cart in the early 80s (I reckon that must be the equivalent of about £90 or about $150 today!) An early case of region protection?!

Gareth.

> Gareth.

I'd say, that most of the unsold UK stock would have been on-sold to other european countries like Poland, etc that seem to have gotten into Atari computers after they had failed everywhere else. There probably were other markets around the world too, that soaked up any unsold stock from the UK.

I dont have any evidence of this, but seems likely.

Atari's UK stock was bought by Derek Fern (Micro Discount) in about 1989-1991 time. He told me that they offered him the contents of all their wharehouses, and that it took many lorries to remove all the stuff! Every time they opened another wharehouse they found more and more unopened boxes of everything from computers down to tapes and carts. Boxes and boxes of them. He also took all their returned-as-faulty stuff, which filled another wharehouse! All this was sold off at the AMS shows, and by mail order. Not sure what he had left by the end, but I suspect he sold it on.

Hello All,

A few people have asked me over the years whether the DGS PD library is available on CD-ROM. Well, it is now! Or at least it will be in a fews days time. All the original master Atari disks have now been copied over to the PC in ATR format. I'm currently creating an HTML catalogue to go on the disc, with extra info on using the disks, etc. The CD will be sold cheap, either on its own or with the current commercial software CD as a combo. It will contain all 191 disks (mostly double sided). I'll post info on price/ordering in a few days time. If you are likely to want a copy of this, please e-mail and let me know. I can then e-mail you directly as soon as it's ready.

Source record: 14752

Folks,

since a few days I am working on a really tricky problem: I would like to switch the basic ROM on and off using bit 1 of $d301. I made sure that display list etc. are moved into an area where it does not collide with the suddely appearing basic at $A000. Still, however, whenever the BASIC is initially off, and I switch it on, the machine crashes, screen turns black.

If it is on initially (not holding option key during boot) I am able to switch it on and off.

What makes my machine crash when I switch BASIC ROM on when it was initially off?

any help is appreciated.

many thanks
Chris

I disassembled an old 'BASICON.COM'. Following is the output:
; Start of code
;
*= $0400
;
LDA PORTB
AND #$FD
STA PORTB
LDA #$00
STA BASICF
LDA #$0C
JSR L0418
LDA #$A0
STA RAMTOP
LDA #$03
L0418 STA IOCB0+ICCOM
LDA #$2A
STA IOCB0+ICBAL
LDA #$04
STA IOCB0+ICBAH
```

```
LDX #$00
JMP CIOV
EOR XMTDON
BRK
;
*= $02E2
;
BRK
.BYTE $04
```

I would guess you're not setting 'BASICF' to 0, ie. BASIC ON.
After clearing bit 1 of portb, you set BASICF ($3F8) to zero, then, good practice, you close IOCB0, Set RAMTOP ($6C) to $A0 then 3 in ICCOM is open. This isn't my code. You should probably close IOCB0 when you're done, and I don't see E: or S: for the OPEN, which will move the display list and screen memory. Shouldn't E: be in ICBAL/H?

2997. Re: switching BASIC on and off without crash

Source record: 14754

I don't mean "E:" in icbal/h, but an address that points to "E:". And I would be setting the aux to 8 for write. I know I'm wrong, because I used BASICON and BASICOFF regularly with SmartDOS, before I had SpartaDOS and quit using it, the commands are built in to SpartaDOS.

Well,
I think I have this BasicON.OBJ file also in my collection - note:
(while booting) it only works when you do not hold down the OPTION key,
otherwise the OS will take control, switch Basic off and the Basicon.OBJ
file will have no effect... But the file is very usefull if you are in
DOS / DUP and want to switch Basic on without rebooting the computer...
-Andreas.

Folks,
thanks for the code. I tried setting BASICF properly but it didn't help. I also tried various other things, like calling RESETWARM after setting RAMTOP and BASICF, but the ultimate results that I am getting are:

If I have BASIC initially on and then switch it on or off, doing a GRAPHICS command (in assembler or C) afterwards things seem to work properly.

Only if the machine is started with BASIC off initially it crashes after setting RAMTOP, BASICF and the Port b bit. (the display list and screen mem are moved to $4000, so that should not be the problem. There still must be something that confuses the OS. Maybe the other memory (low, high) pointers that get initialized when basic is on. I don't know. I will keep looking. Of course if you have more ideas, they are wellcome.

thanks
Chris

BTW: C programm that I am using to experiment is attached. compiles with cc65 and -Cl -O -T -l -v -t atari -m memexchk.map -C memexchk.cfg
see: /// BASIC on/off section

Folks,

it seems that I found a way to switch on BASIC even if the system was started with option(BASIC off): I put the OS memory pointers in the state that they are supposed to have when BASIC is on before actually switching it on.
Only problem still is that after the code below was executed my app keeps working properly, but return to DOS (ESC) crashes the machine.

Obviously I am still missing to set something in the system...

Chris

```
-- snip
case '2': {

asm ( "sei" );
dmactl = *(unsigned char*)0x022F;
*(unsigned char*)0x022F = 0; // dmactl shadow
//*(unsigned char*)DMACTL = 0; // direct in antic

*RAMTOP = 0xA0;
*RAMSIZ = 0xA0; //(char*)0x02E4 //;RAM SIZE (HI BYTE ONLY)
*(int*)MEMTOP = 0x9C1F; //(void*)0x02E5 //;TOP OF AVAILABLE USER MEMORY
//MEMLO (void*)0x02E7 ///;BOTTOM OF AVAILABLE USER MEMORY
*(int*)APPMHI = 0x8035; //(void*)0x0E

_graphics(0);

*(unsigned char*)0x022F = dmactl;
//*(unsigned char*)DMACTL = 0;
*(unsigned char*)0x03F8 = 0;

asm ( "cli" );

asm ( "lda %w", PORTB ); // switch it on
asm ( "and #$fd" );
asm ( "sta %w", PORTB );

asm ( "jmp ($bffe)" ); // jump to BASIC cartridge

printPbStatus( PIA.portb, 0,4 );
break;
}

-- snip
```

Sorry for the delay, Mathy. Been sick for most of the last three weeks.

Yes, I make the av breakout boxes..they just bring out the signals in a convienient form.

Our old computer group had meetings and used a simple multi out box, no electronics except maybe capacitors,
so we could have a monitor at each end of a 30 foot table and one for the demo person behind the table.
Worked quite nice. I would get concerned if the length got any longer. Good displays help.

There are video amplifiers(not cable RF) at many higher end consumer stores.

The only way to get stereo from the 8 bit is to add another Pokey chip(the Gumby mod I think from AC magazine).

I use XLIT and ATARI800win mostly. And instead of messing with the options
in the emulator to get BASIC on or off, I use a binary load BASIC file.
Mostly use SpartaDOS X33A.DOS. When I want BASIC, I just load it.
Then DOS takes me back to the D1:> prompt. I regularly RUN
E477 to overcome hangs, tho, pushing RESET doesn't work as well as a warm
start. I don't remember how well my binary load BASICB does with MyDOS,
DOS 2.5, but I think it works. It must be possible to make a good
BASICON/OFF, because SpartaDOS does it pretty reliably.

Interesting... there have been a couple of threads about the XEP80 recently.

I'm very interested in the XEP80, but it seems like there has not been very much interest elsewhere (threads die quickly). And there isn't much known about it, except that this is one of the most poorly performing pieces of hardware released by Atari.
What does it do poorly:
1) It overscans many/most monitors in both vertical and horizontal. It does work with some VGA line doublers, but will not display properly on any flat-panel display that I've tried (several brands).
2) It's text font looks bad (IMO, at least) -- much too tall for it's width which adds to the vertical overscan issue.
3) It's slow, but I could live with that.

Could it be fixed with reasonable effort? I think so, but my electronics skills are too limited to effectively deal with the issues. But I've thought about it...

Couldn't its scan frequency be increased to reduce the overscan? I think the software driver would have to be revised to accomodate the new timing. (?)

Couldn't the font be changed (making the letters not so tall) as another way to get rid of the vertical overscan?

Are there any sites that have info about the XEP or its chip? I've been able to find two technical articles about the XEP, and that's it.

Larry

Hi Edward,

I have good experience with IBM 2.5" traveldisk. I have build several 4.8 Gb into XE's and XL's. No problem with them. But you still need to check if the drive, you buy, is OK with the Atari setup..... But then, these 'obsolete' drives are cheap now ;-)

Kind regards,
Mr.Atari.

Well I decided to officially announce my site as being open. I would
say it is still in a beta stage as I don't have everything posted yet
online for sale. But check it out and kick the tires.

Stuff for sale on the site includes:

Atari, Commodore, TI, Nintendo, Sega, Coleco, Intellivision, and More.

It's not as rare as you might think, I see one on Ebay about twice a year.
To me what would make a voice synth rare would be a unique interface, like a
joystick port or cartridge. I personally would feel alright about spending
up to $40.00 on an Alien Group Voicebox and that would be with the original
paperwork.
There are alot of other brands that are more readily available like
DECtalkers and even good software synths like S.A.M (software automated
mouth).
I think the real question would be is how much is it worth to you?
Mo

3013. MAC/65 Toolkit?

Newsgroup: comp.sys.atari.8bit

From: Slor <slor@comcast.net>
Message-ID: <Xns9550F2A67E42Demuslor@130.133.1.4>
Source record: 14770

I saw something about a MAC/65 Toolkit in one of the Page 6 issues. It is reported to be an extensive collection of macros for use with MAC/65. I have not been able to find it in any of the disk collections that I've run across. Could someone please point me to an ATR image of this beast?

Thanks a bunch!

yea that is about right. Actually IMO the Voicebox is probably the
best of the voice synth for the Atari. It worked better then SAM
(which I also had) used less memory etc... Of course it is just a
collectable now. Im suprised you saw some on EBAY, because I checked
and none came up.

Hello All,

I have just put 10 Atari 800/XL/XE 2.5m GOLD OFC SCART cables on to eBay as a buy-it-now. These new special edition 'pro series' cables are made from OFC triple-screened audiophile-grade cable, with gold-plated screw-type plugs. This makes them expensive and heavy (so expensive shipping) but these are my best cables yet. Quantities are limited. The link is:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=8127678973

I have the manual somewhere in storage too. But I guess you might be able to look through and guess what the macros do. Or do you already have a book that refers to them? I know it has a smooth scroll routine in there too.

I only have the MAC/65 w/ DDT manual. If you happen to run across the
manual for the toolkit, that would be quite helpful as well.

Thanks again.

Have you been on my site? On the "stuff" page?

BTW the main chip in the XEP80 is the NS405. Check out the sites that have
data sheets. There is this one site that starts with "free" IIRC, but I
forgot it's name.

3027. New DGS Atari 8-bit PD Library CD - update

Newsgroup: comp.sys.atari.8bit
Date: 2004-08-27 14:44:25 UTC
From: dgs@clara.net
Message-ID: <3568e886.0408270644.73d74b5c@posting.google.com>
Source record: 14784

Hello All,

Just a quick update on my progress with the new DGS PD library CD. I have now finished the catalogue/info file that will go on the disc, but I need to check it for errors. I also want to add extra usage info, etc. where possible. I will do this over the weekend.

The CD should be available early next week. It will be sold as a budget CD, which basically means no on-disc label and no case. It will come in a plastic wallet with a small instruction sheet. The price will be low, with options for surface mail (to make it very cheap!) or airmail. It will be shipped in a bubble-lined envelope with a thick piece of card so it shouldn't get bent during shipping. It will also be available as a combo with the current DGS commercial software CD.

You can see what will be on it by going to the DGS website (http://www.dgs.clara.net) and looking at the current PD catalogue.

If you know you are likely to buy a copy of this, please e-mail me and let me know. I can then e-mail you when it's ready to go.

Dean Garraghty (dgs@clara.net)

Do you have a copy of the T.W.A.U.G version of mapping the Atari, blue backed, spiral bound like the earlier 'compute' books and a5 format in two volumes... In volume 2 it has an o/s listing supplied by the author (don't ask me if it was xl/e or what version)

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon

service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

FAX: (972) 228-0693
http://www.telegames.com/
Vendor: commercial software

Vladimir Tichy 4/04
Hrdlovska 650
41705 Osek
Czech Republic
http://sdq.webpark.cz/ or http://sdq.paraglide.cz
Developer: Atart ("ATAri Receiver and Transmitter") --
"The first Atari 8-bit casette dataset emulator for PC in the world.
Easy tool for archiving atari casettes to the PC files" --
Atart 3.00.0 interface - construction and manual,
Atart 1.07.0 program zip archive (manual contained)

trub 8/04
Poland

http://trub.sys.net.pl/
Developer: utilities for the Atari: SIO2IDE Commands (S2I) 0.7, TDPL 2.0,
XEP.SYS 0.1D (beta), TRACE2, RWTEST2, QE 2.0, S2I JukeBox 2.0.
Utilities for MSDOS: XLDisk (Atari file format converter) 2.5

Anthony Jaroslav Truhlar 12/03
England
http://www.truhlar.org/
Developer: CopyPlus 1.1, Metric/Imperial converter, resistance calculator,
several other programs. (Mainly working these days on HP Alpha (VMS), Sparc
(Solaris) & x86 (Linux) but maintains an interest in the Atari 8-bit.)

Vasyl Tsvirkunov 1/03
http://pocketatari.retrogames.com/
Developer: Pocket Atari 2002/05/13 (Atari800 emulator ported to
Windows CE 3.0+), versions for: StrongARM (iPAQ, etc.), MIPS (Casio, etc.),
SH3/4 (Jornada, etc.)

Steven J. Tucker 1/04
3978 Brookside Blvd
Cleveland OH 44111-5106
USA
tel: 216-577-8329
http://www.atarimax.com/
Developer: APE, the Atari Peripheral Emulator: APE and ProSystem v2.0.7 for
Win 95/98/ME/NT/2000/XP, APE & ProSystem 1.18 for DOS/Win3/95/98, APE Warp+
OS for XL/XE machines, Imagic 1.06 95/NT--the Atari Disk Image Conversion
System for 9x/NT, Imagic 1.06 DOS--the Atari Disk Image Conversion System
for DOS (Imagic does disk image (ATR <-> XFD <-> DCM <-> SCP) conversion),
Atari Terminal Simulator ATS 2.0 (ATASCII Telnet/Serial Terminal & Break
Movie Player for 32bitWin), Break Movie Screensaver for 32bitWin, MaxFlash
Flash Cartridge (1Mbit or 8Mbit), SIO2PC/ProSystem Universal Interface

UPDATES SINCE PREVIOUS POSTING
2004.08.14 3.8 SIO2IDE URL updated, thanks dely
2004.07.15 2.1 URL to Clarence Dyson's page updated, thanks Keith
2004.07.15 1.11 URL to Atari Historical Society page updated, thanks Keith
2004.07.14 8.3 more Multijoy games added (thanks Matthias)
2004.07.14 3.5 Karin Maxi and HDI info added/clarified
2004.06.28 3.5 double-sided drive mapping possibilities added

---

Subject: 0.1) Table of contents

0.1) Table of contents

The Computers
1.1) What is an Atari 8-bit computer?
1.2) What is the Atari 400?
1.3) What is the Atari 800?
1.4) What is the Atari 1200XL?
1.5) What is the Atari 600XL?
1.6) What is the Atari 800XL?
1.7) What is the Atari 65XE?
1.8) What is the Atari 130XE?
1.9) What is the Atari 800XE?
1.10) What is the Atari XE Game System?
1.11) What are the 6502, ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?
1.12) What is the internal layout of the 8-bit Atari?
1.13) What issues surround NTSC vs PAL versions of the 8-bit Atari?
1.14) What are the pinouts for the various ports on the Atari?

Video Display
2.1) What video display devices can I use with my Atari?

Mass Storage
3.1) What are the Atari 410, 1010, XC11, and XC12 Program Recorders?
3.2) What other cassette recorders can I use with my Atari?
3.3) How do I run a program from cassette?
3.4) What are the Atari 810, 815, 1050, and XF551 Disk Drives?
3.5) What other floppy disk drives can I use with my Atari?
3.6) What kinds of 5.25" floppy disks can I use with my Atari drives?
3.7) What can I do to extend the life of my floppy disks?
3.8) How can I use a hard drive with my 8-bit Atari?

Printers
4.1) What are the Atari 820, 822, and 825 Printers?
4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?
4.3) What are the Atari XMM801 and XDM121 Printers?
4.4) What other printers can I use with my Atari?

MODEMs
5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?
5.2) What other modems can I use with my Atari?

More hardware
6.1) What is the Atari 850 Interface Module?
6.2) What is the Atari XEP80 Interface Module?
6.3) What accessories did Atari produce for their 8-bit computers?
6.4) What "vaporware" computers/peripherals were never released?
6.5) What are the power requirements for my Atari components?
6.6) What graphic tablets were produced for the Atari?
6.7) What lightpens were produced for the Atari?
6.8) What lightguns were produced for the Atari?
6.9) What paddles were produced for the Atari?
6.10) What voice/sound synthesis hardware was produced for the Atari?
6.11) What sound-digitizers/samplers were produced for the Atari?
6.12) What sound-enhancement upgrades were produced for the Atari?
6.13) What MIDI enhancements are there for the Atari?
6.14) What graphics enhancements are there for the Atari?
6.15) What types of memory upgrades are there for the Atari?
6.16) What networking hardware is there for the Atari?
6.17) Can I attach an ISA card to the Atari?
6.18) What preventative maintenance can I do on my Atari system?

Core software: OS, BASIC, DOS, Modem handlers
7.1) What versions of the Atari Operating System (OS) are there?
7.2) What is the ATASCII character set?
7.3) What is Atari BASIC?
7.4) What are Atari DOS 1, DOS 2.0S, DOS 3, DOS 2.5, and DOS XE?
7.5) What are MyDOS, SpartaDOS, and other popular DOS versions?
7.6) How do I modify Atari DOS to support more than two drives?
7.7) Are there Graphical User Interfaces (GUIs) for the Atari?
7.8) What should I know about modem device handlers?

Software
8.1) What programming languages are available for the Atari?
8.2) What cartridges were released for the Right Slot of the 800?

8.3) What games support 4 or more simultaneous players?
8.4) What programs run only on the 400 and 800 models, and why?
8.5) What programs make use of the Light Gun or a light pen?
8.6) What programs have a track ball mode or support a mouse?
8.7) What programs have a paddle(s) or Koala Pad mode?
8.8) What programs have a CX85 Numerical Keypad mode?
8.9) What programs have a Touch tablet mode?
8.10) What kinds of RAMdisks can be set up on the Atari?
8.11) What programs support a RAMdisk?
8.12) What programs require a RAMdisk?
8.13) What voice/sound synthesis software is there for the Atari?
8.14) What programs support stereo and upgraded sound?
8.15) What games support online action via modem?
8.16) What programs support Atari computer networking?

Working with Atari files: Compression, File formats, Copying
9.1) How can I work with .arc files on my 8-bit Atari?
9.2) What file formats for entire disks/tapes/cartridges are there?
9.3) How can I copy my copy-protected Atari software?

Interoperating with "modern" computers
10.1) What programs can log in to other computers via modem?
10.2) What programs can I use to host a BBS on the Atari?
10.3) How can I read/write Atari disks on an MS-DOS PC?
10.4) How can I read/write MS-DOS PC disks on my Atari?
10.5) How do I transfer files using a null modem cable?
10.6) How can my Atari use my PC's HD using SIO2PC or Atari810?
10.7) How can my Atari use my PC's HD, printer and modem using APE?
10.8) How can I connect my 1050 drive to my PC with the APE ProSystem?
10.9) What about interoperating with the Apple Macintosh?
10.10) Are there 8-bit Atari tools for the Commodore Amiga?

Timeline
11.1) How did Atari get its name?
11.2) What is the History of Atari?

Subject: 1.1) What is an Atari 8-bit computer?

Based in Silicon Valley in the U.S.A., the company known as Atari produced a line of home computers from 1979 to 1992 often referred to collectively as the "Atari 8-bits," the "8-bit Ataris," the "400/800/XL/XE series," etc.

The computers included the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

These machines competed in the marketplace most directly with the likes of the Commodore 64 series, the Apple II series, the Texas Instruments TI99/4A, and the Radio Shack Color Computer, among others. Of these, the 8-bit Atari is most similar to the Commodore 64.

In marketing their computers to the public, Atari always had to contend with their company history and reputation as a maker of video games. While the 8-bit Atari computers in their heyday were technically quite comparable if not superior in the worlds of home and business personal computing, they also live up to the name "Atari" with a huge library of video games which were often outstanding for their time.

The 8-bit Atari computers do not use the same cartridges or floppy disks as any other Atari platforms, such as the 2600 Video Computer System (VCS), the 5200 SuperSystem, the 7800 ProSystem, or the ST/TT/Falcon computers. All of these but the 5200, however, do share the same joystick/controller hardware port.

The 5200 SuperSystem is actually nearly identical to the 8-bit computers internally, yet cartridges for the 5200 and the 8-bit computers cannot be exchanged, primarly due to the physically different cartridge ports.

Here are some of the performance specifications of the 8-bit Atari computers:

(Some of the rest of this section by Bill Kendrick)

CPU: 6502 (MOS Technology)

CPU CLOCK SPEED:
NTSC machines: 1.7897725 MHz
non-NTSC machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

GRAPHICS MODES:

ANTIC Mode #	CIO/BASIC Graphics #	Type	Display Resolution (full screen)	Number of Colors
2	0	Char	40 x 24	1 *
3	-	Char	40 x 19	1 *
4	12	++ Char	40 x 24	5
5	13	++ Char	40 x 12	5
6	1	Char	20 x 24	5
7	2	Char	20 x 12	5
8	3	Map	40 x 24	4
9	4	Map	80 x 48	2
A	5	Map	80 x 48	4
B	6	Map	160 x 96	2
C	14	++ Map	160 x 192	2
D	7	Map	160 x 96	4
E	15	++ Map	160 x 192	4
F	8	Map	320 x 192	1 *
F	9	+ Map	80 x 192	1 **
F	10	+ Map	80 x 192	9
F	11	+ Map	80 x 192	16 ***

* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances

*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16
luminances x 16 hues = 256 colors. (Four registers are for player-missile
graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse
video incarnation, are totally redefinable.

PLAYER-MISSILE GRAPHICS: (byte height and OR corrections from Piotr Fusik)
Four 8-bit wide, 120 or 240 byte high single color players, and four
2-bit wide, 120 or 240 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also
available, as is a mode to OR colors or blacken out colors when players
overlap (good for making three colors out of two players!) Players
and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display
List - a program which is executed by the ANTIC graphics chip every
screen refresh:

All other screen attributes (color, player/missile horizontal position,
screen width, player/missile/playfield priority, etc.) can be ajusted
at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any
line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Subject: 1.2) What is the Atari 400?

Released along with the 800 in 1979, the 400 was the low-end model of the two.
The only 8-bit Atari with a membrane keyboard rather than a full-stroke
keyboard. One of the few 8-bit Ataris lacking a composite monitor port.
Originally released with just 8K RAM, but most were sold with 16K RAM. Atari
sold the Atari 400 48K RAM Expansion Kit, which required a little soldering,
to dealers only.

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 400 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 1982 Atari catalog calls the 400 "The Basic Computer."

The 400 was discontinued in 1983.

During development the 400 was known internally as "Candy."

Subject: 1.3) What is the Atari 800?

Released along with the 400 in 1979, the 800 was the high-end model of the two. The 800 is the only 8-bit Atari with a Right Cartridge slot, in addition to the Left Cartridge slot as present on all 8-bit Ataris. Originally released with just 8K RAM, many were sold with 16K, later on 48K was standard.

The 800 is also the only 8-bit Atari with a four-slot modular design, where the first slot holds the CX801 (CX801-P for PAL machines) 10K ROM module, and the other three slots hold combinations of CX852 8K or CX853 16K RAM modules.

Jason Harmon writes: (12 Feb 2004)
"..the early ones had plastic cases on the ROM and RAM modules, and had two thumb tabs to remove the cover to access the modules. Later model 800s had 48K standard, and to improve cooling Atari installed them without the cases but put a small plastic strip across the tops of the cards to hold them in position. These machines also lost the thumb tabs and have regular screws to secure the cover over the memory slots."

Only the 400 and 800 8-bit Atari models have four controller (joystick) ports.

Early 800 units include the CTIA chip; later units include the GTIA chip, also present in all later 8-bit Ataris.

The 800 was discontinued in 1983.

During development the 800 was known internally as "Colleen."

Subject: 1.4) What is the Atari 1200XL?

Released as a big brother to the 400/800 in 1982, the 1200XL now uses Atari's slightly customized 6502C microprocessor, and includes a full 64K RAM. The 1200XL was the first 8-bit Atari with just 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, 4 LEDs, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

The 1200XL was the biggest single step forward in development of the 8-bit Atari platform, but the corresponding software compatability problems hurt its

popularity.

The 1200XL lacks separate chroma video signal, and also lacks the +5 Volts power on pin 10 of the SIO port.

There is no PAL (European) version of the 1200XL.

The 1200XL was discontinued in 1983.

Subject: 1.5) What is the Atari 600XL?

Released in 1983 as a replacement for the 400, the 600XL is the low-end version of the 800XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the Atari 1064 Memory Module.

Rarely, some late-model 600XLs were sold with 64K RAM. These may have only appeared in Canada. The box had a round gold foil sticker reading: "64k Memory -- Now with a full 64k of memory built-in."

Normally boots with Atari BASIC (Revision B) enabled; Hold down [Option] on startup to boot without BASIC.

The North American/NTSC 600XL does not include a composite monitor port; The European/PAL 600XL includes the monitor port, but this lacks the chroma video signal.

The 600XL was discontinued in 1985.

Subject: 1.6) What is the Atari 800XL?

Released in 1983 as a replacement for the 800 and 1200XL, the 800XL is the high-end version of the 600XL. The 600XL/800XL include most of the features of the 1200XL minus the Function keys and the demo program. But both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM.

Normally boots with Atari BASIC (Rev. B, or late models with Rev. C) enabled; Hold down [Option] on startup to boot without BASIC.

The 800XL lacks separate chroma video signal (exeception next paragraph).

There was a late version of the 800XL in Europe, called 800XLF. The 800XLF includes a redesigned motherboard (the XE design) and contains FREDDIE for memory management and has chroma output. BASIC is Revision C.

Though Atari never disclosed sales figures, the 800XL was likely the most-sold of all 8-bit Atari computer models.

The 800XL was discontinued in 1985.

Subject: 1.7) What is the Atari 65XE?

Released in 1985 as a replacement for the 600XL, the 65XE is the low-end version of the 130XE. The 65XE is nearly identical to the 800XL in features, minus the PBI. Many European (PAL) 65XE's include the ECI port, but no North American (NTSC) 65XE's include the ECI port. All XE computers also include the FREDDIE memory management chip.

Normally boots with Atari BASIC (Revision C) enabled; Hold down [Option] on startup to boot without BASIC.

The 65XE was discontinued in 1992.

Subject: 1.8) What is the Atari 130XE?

Released in 1985 as a replacement for the 800XL, the 130XE is the high-end version of the 65XE. The 130XE offers 128K RAM, plus the FREDDIE memory management chip, supporting the unique (but rarely used) ability for the 6502 and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of a fast parallel port.

Normally boots with Atari BASIC (Revision C) enabled; Hold down [Option] on startup to boot without BASIC.

The 130XE was discontinued in 1992.

Subject: 1.9) What is the Atari 800XE?

Unseen and unknown in North America, the 800XE was sold in eastern Europe. The 800XE is identical in features to the European version of the 65XE, including the ECI port. The 800XE could also be described as a 64K version of the 130XE.

Normally boots with Atari BASIC (Revision C) enabled; Hold down [Option] on startup to boot without BASIC.

Jindrich Kubec writes, "The problematic Chinese 800XEs with GTIA problems were manufactured in 1992."

The 800XE was discontinued in 1992.

Subject: 1.10) What is the Atari XE Game System?

In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game, while offering 64K RAM and full compatibility with the 65XE. It was packaged with the Light Gun, and the Flight Simulator II and Bug Hunt cartridges.

Keyboard connected/no cartridge:
boots to Atari BASIC
Keyboard connected/no cartridge/[Select] held down at startup:
boots to Missile Command
No keyboard connected/no cartridge:
boots to Missile Command
No keyboard connected/no cartridge/[Select] held down at startup:
boots from disk drive
No keyboard connected/no cartridge/[Select]+[Start] held down at startup:
boots from tape drive

[Option] held down at startup = BASIC on
[Option] not pressed at startup = BASIC off
(opposite from all other XL/XE machines)

Andreas Magenheimer writes:
Tip: The confused XEGS Atarian should use the XEGS manager by Mat*Rat (Mathew Ratcliff). This assumes one knows at least how to boot a disk with the XEGS...

James Bradford offers:
There is only 1 32K ROM in the XEGS, it has the OS, BASIC (Rev C) and Missile Command on it.

The XE Game System was discontinued in 1992.

Subject: 1.11) What are the 6502, ANTIC, CTIA/GTIA, POKEY, and FREDDIE chips?

Some of the following text is taken from De Re Atari (Atari#APX-90008), a book published by Atari through the Atari Program Exchange (APX) and copyright 1982 by Chris Crawford, et al. See http://www.atariarchives.org/dere/ where the full text of De Re Atari is now available online.

The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a PIA. However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

6502 Central Processing Unit (CPU)
====
While the 400/800 models contain a generic 6502B CPU (a faster version of the original 6502A microprocessor), all of the XL/XE models contain Atari's customized 6502C chip.

On the Atari, there are two microprocessors, ANTIC and the 6502. To allow them to coexist, ANTIC must shut off the 6502, a process called DMA. The 6502B supports DMA, but in Atari's implementation, it required 4 chips. The 6502C has an extra line called HALT. It is controlled by ANTIC which uses it whenever it needs the data/address bus. The HALT line is on pin 35 of the Atari 6502C and must be pulled high for the chip to work.

ANTIC
=====
ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

Frank Schuster writes (6/1/02):
the patent for the ANTIC processor:

U.S. Patent 4,296,476 October 20, 1981 for a "Data processing system with programmable graphics generator". Inventors listed: Steven T. Mayer; Jay G. Miner; Douglas G. Neubauer; Joseph C. Decuir

CTIA/GTIA
=========
CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missile graphics, and collision detection.

Early 400/800 models included CTIA, later 400/800 models and all later 8-bit Ataris included GTIA.

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell provides this tidbit:
A bit of trivia: CTIA 400/800s artifact in blue/green, GTIA 400/800s artifact in green/blue, and all XL/XEs artifact in red/blue.

Jerry Jessop explains why French Ataris produce fewer colors:
I will tell you why it only has monochrome out, because it's SECAM and a

SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible.

Frank Schuster writes (6/1/02):
..here a summary of Atari patents covering technical parts of the GTIA / CTIA or at least the steps of development to it. I found them by following the references made in the "newest" patent 4,324,401 which at the end stands for the GTIA.

U.S. Patent 4,324,401 April 13, 1982 for a "Method and system for generating moving objects on a video display screen". Inventors listed: David R. Stubben, Lyle V. Rains. References: 4,116,444; 4,107,665

U.S. Patent 4,189,728 February 19, 1980 for an "Apparatus for generating a plurality of moving objects on a video display screen utilizing associative memory". Inventor listed: David R. Stubben. References: 4,116,444; 4,045,789

U.S. Patent 4,116,444 September 26, 1978 for a "Method for generating a plurality of moving objects on a video display screen". Inventors listed: Steven T. Mayer; Ronald E. Milner. References: 4,016,362; 3,793,483

U.S. Patent 4,107,665 August 15, 1978 for an "Apparatus for continuous variation of object size on a raster type video screen". Inventors listed: Steven T. Mayer; Ronald E. Milner

U.S. Patent 4,045,789 August 30, 1977 for a "Animated video image display system and method". Inventor listed: Stephen D. Bristow. References: 3,793,483

U.S. Patent 4,016,362 April 5, 1977 for a "Multiple image positioning control system and method". Inventors listed: Stephen D. Bristow; Steven T. Mayer. References: 3,793,483

U.S. Patent 3,793,483 February 19, 1974 for a "Video Image Control System for Amusement Device". Inventor listed: Nolan K. Bushnell

POKEY
=====
POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips.

The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The USPTO granted U.S. Patent 4,314,236 to Atari on February 2, 1982 for an "Apparatus for producing a plurality of audio sound effects" - POKEY. Inventors listed: Steven T. Mayer, Ronald E. Milner

FREDDIE
=======
The 65XE/130XE/800XE/XEGS contain a small additional LSI called FREDDIE, a RAM address multiplexer. According to James Bradford, "FREDDIE is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDIE also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDIE but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDIE, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDIE for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDIE does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDIE) and an extra 8 RAM chips."

And more recently James Bradford has written:
FREDDIE is just a memory decoder and timer. It replaces several chips in the 800XL. The small chip near FREDDIE does all the bank selection. CO25953. One line from FREDDIE, Ras (or is it cas?) goes to this chip, Halt and the bank /processor select lines go into this same chip and ras (cas?) comes out. A pin for each bank. If I remember correctly, refresh also goes into this small chip. It would be quite easy to make an 800XL work just like a 130XE with this chip since Ras (Cas?) is required by ALL dynamic RAM.

======
Technical data sheets and schematics for the ANTIC, GTIA, and POKEY chips are available on Curt Vendel's web site, thanks to permission from Hasbro's Atari Interactive Division's release of this data. See the TIFF scans:
http://archives.atarimuseum.com/archives/archives-techdocs.htm
Keith Howell has converted the hi-res TIFFs into clean HTML:

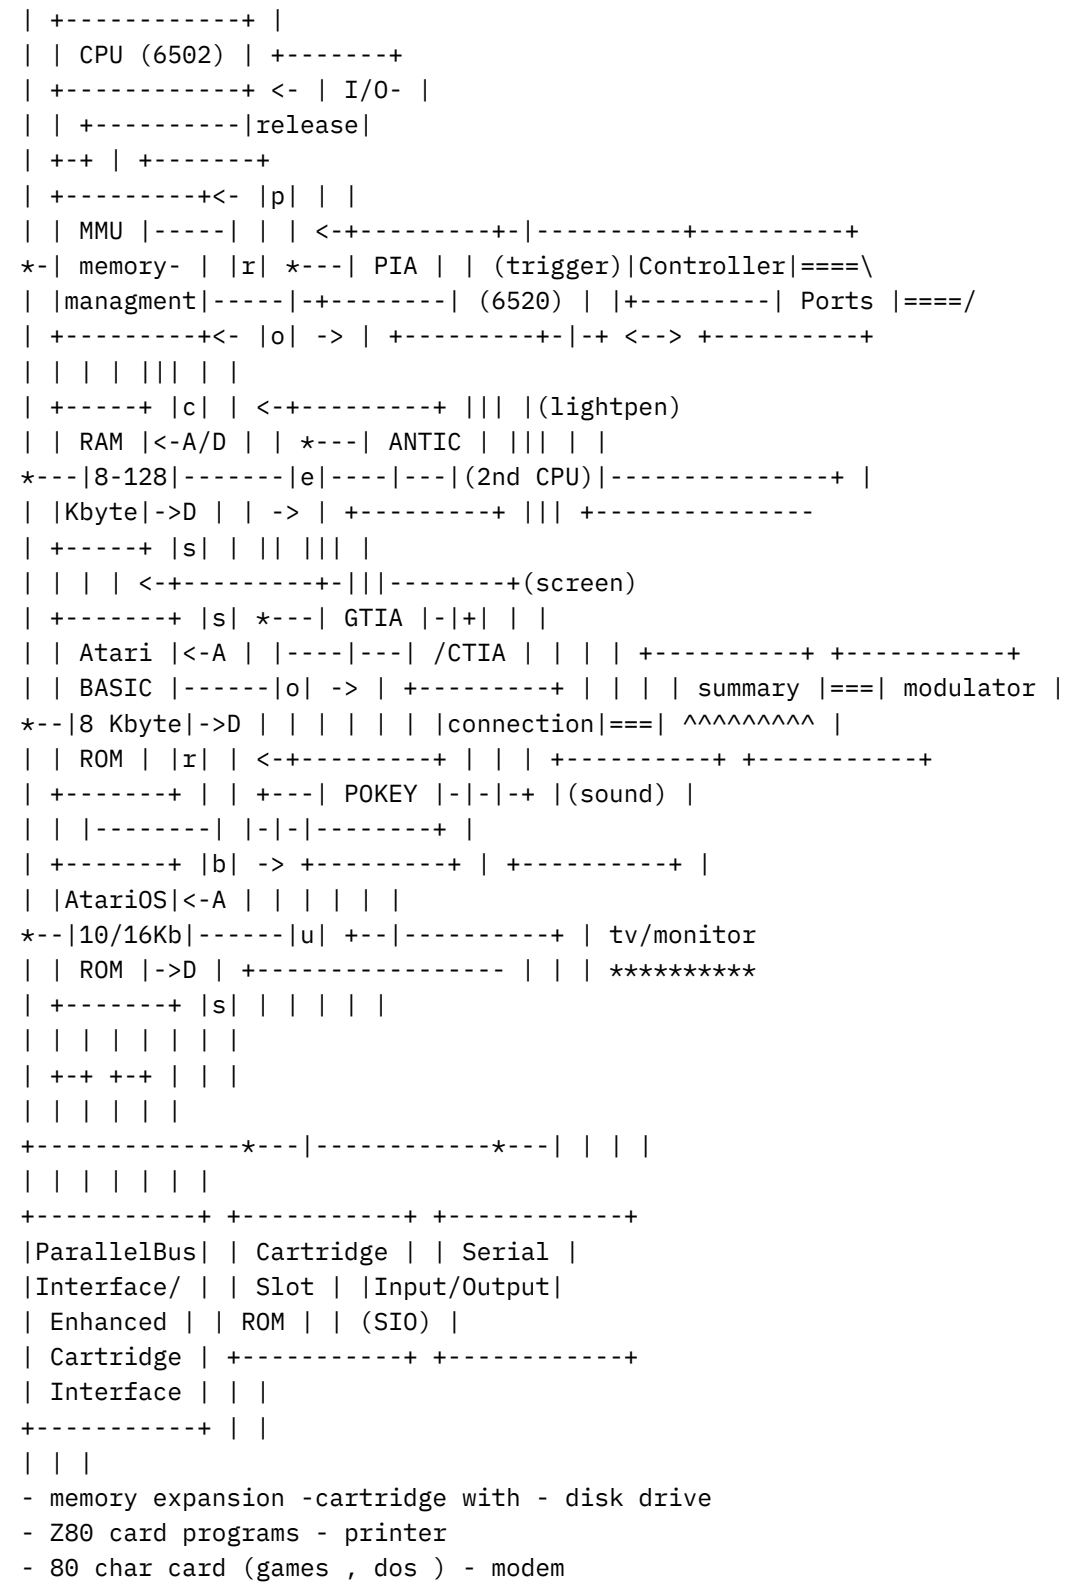
Subject: 1.12) What is the internal layout of the 8-bit Atari?

ASCII art by Thomas Havemeister.

->
+--------------------------------------+



- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard

130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502B, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE/many PAL 65XE only
* Some late XE's use a 68B21 for PIA; PIA is 6520/6520A on all others

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan), Jerry Jessop, Scott Emmons

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan
Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

According to Atari Explorer magazine, the 130XE was engineered by Jose Valdes.

Subject: 1.13) What issues surround NTSC vs PAL versions of the 8-bit Atari?

Contributors to this section:
Wayne Booth, Graham Thornton, Brent Buescher Jr., Thomas Richter, Jindroush

Some quick definitions first:

NTSC standard: Abbreviation for "National Television Standards Committee"
TV signal standard used in North America, Central America, a number of South
American countries, and some Asian countries, including Japan.
525 lines per frame
60 half-frames per second (interlaced) = 60 Hz
Complete frame refreshed 30 times per second

PAL: Acronym for "phase alternation by line"
TV signal standard used in the United Kingdom, much of the rest of western
Europe, several South American countries, some Middle East and Asian
countries, several African countries, Australia, New Zealand, and other
Pacific island countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz

Complete frame refreshed 25 times per second.

PAL-M: A modified version of PAL, used in Brazil.

SECAM: Acronym for "systeme electronique couleur avec memoire"
TV signal standard used in France, eastern European countries, the former USSR, and some African countries.
625 lines per frame
50 half-frames per second (interlaced) = 50 Hz
Complete frame refreshed 25 times per second.

Now then, how do the differences among 8-bit Atari computers designed for the different world television signal standards affect users trying to use software written elsewhere in the world?

The 50Hz vertical refresh frequency of PAL machines translates into more vertical blank interrupt (VBI) time for demos and other computation-intensive graphics software, when compared to the time available for VBIs on NTSC machines with the faster 60Hz refresh frequency. So PAL demos and games that won't work on NTSC machines are usually returning from a VBI too late. Some also attempt to use more vertical resolution ("longer" display lists) than an NTSC display can handle.

Note that the reverse is also true. Software using VBIs will run more slowly on a PAL Atari than on an NTSC Atari.

Replacing the NTSC ANTIC chip in an NTSC Atari with a PAL ANTIC changes the screen refresh rate to 50Hz, allowing most of the PAL-only European software to run on a North American NTSC Atari. However, make sure your display device can support a 50Hz PAL signal first! North American Atari users can also obtain and use real European PAL Atari machines, with the same caveat concerning the display device.

Bottom line:
Software written for NTSC machines (North America) will (almost) always work on PAL machines (Europe), but software designed on PAL machines won't necessarily work on NTSC machines.

Jindroush contributes: (2/26/02)
Could there be a program which runs on NTSC Atari and not on PAL Atari? Yes, if it uses some precise timing copy protection (probably based on vblank timing). Examples of these are Transylvania and The Quest by Penguin Software.

Thomas Richter mentions another NTSC vs PAL issue:
Another point is that the popular pseudo-colors used in the ANTIC-F (Graphics 8) mode are not colorful at all when displayed on a PAL TV, because of differences in the color encoding for the TV. The schematics of the XL computers include however a hack how to change the PAL version to the NTSC version (the PAL versions include two crystals, one with 5/4th of the frequency of the other. One is used for the system clock, the other for the color clock), but I never dared to apply it.

And on 10/16/03 Thomas Richter answered a related question this way:
>> Note that it's typically not too hard to get an NTSC Atari to run in PAL
>> by just swapping out the ANTIC chip.
>>
>> Unfortunately, some demos actually check the OS ROM for a particular
>> value to see if it's a PAL machine or not, and then refuse to run if
>> they are. *grumble* I'd rather have a warning than a refusal. :^P

> As far as I am aware, the only value to tell a PAL from a NTSC machine is in
> GTIA. Maybe swap that one as well and see what you get

Absolutey correct, GTIA keeps the PAL/NTSC register and the Os rom reads it
from there. However, besides the GTIA PAL and NTSC machines differ in other
aspects. For example, on PAL machines an additional oscillator of 5/4 of the
main frequency is present to generate the color frequencies needed to drive
GTIA. There is no such circuit in NTSC Ataris. Besides, this factor of 5/4 is
also the reason why you don't get "artifacted colors" on PAL machines (or, at
least, not very good ones.)

Subject: 1.14) What are the pinouts for the various ports on the Atari?

Controller Port (4 on 400/800, 2 on all others):

Subject: 2.1) What video display devices can I use with my Atari?

Contributors to channel output variations list:
Jon Levy, Rene de Bie, Sysop Fox-1

Most 8-bit Atari computers put out video signals in two places:

1) Radio-Frequency (RF) signal, either one VHF channel, or two VHF channels selectable by a switch on the computer. Variations depend primarily on the part of the world that the particular version of the computer was desgined for.

Most North American computers: VHF channels 2-3 switch-selectable.
channels 3-4 switch selectable also reported
European computers: VHF channels 3-4 switch-selectable,
or no switch (what channel?) both reported
UK computers: VHF channel 36, no switch,
or channels 38-39 switch selectable both reported
Australian computers: VHF channel 1 (400/800: channels 1-2 selectable)

Any further clarifications would be appreciated!

Accessories needed:
a) RF Cable. (RF=radio frequency--video and audio signals in the same line)
On the 400/800 models, the RF Cable does not detach from the computer.
The output end of the cable is an RCA male connector.

b) TV Switch Box. Includes an RCA female connector for RF signal input from the Atari, input connector(s) for your TV attenna and/or cable TV company, and 75- and/or 300-ohm VHF output connector(s) for connection to the VHF input on the television. (Radio Shack carries a suitable TV Switch Box.)

2) A proprietary 5-pin DIN Monitor Jack, which includes two video signals:
a) Composite video.
b) Y/C Video, also known as S-Video:
separate composite luminance (Y) and chrominance (C) signals.

Exceptions among the computer models:
-the 400 and North American 600XL lack the Monitor Jack.
-the XE Game System includes an RCA-style jack in place of the Monitor Jack, providing a plain composite video signal only.
-the Monitor Jack on the 600XL, 800XL(most) and 1200XL lacks the separate chrominance signal. (But it exists internally, and can be restored to the

monitor jack via hardware modification.)

The pinout for the Atari Monitor Jack is in the pinouts sections of this FAQ list.

The typical Atari Monitor Cable includes the male 5-pin DIN connector on one end, and two RCA male connectors on the other end. One of the RCA connectors will carry the monophonic sound signal, and the other will carry the composite video signal. Color composite monitors were common in the mid-80's, but these days many televisions have an RCA female composite video input connector which works fine with the Atari.

You may find an Atari Monitor Cable where the video signal carried on the second RCA connector is not the composite video signal, but the composite luminance signal. These cables are for use with monochrome composite video monitors (usually green or amber).

The ideal Atari Monitor Cable includes 3 RCA male connectors on the output end, carrying the sound signal, the composite luminance signal, and the composite chrominance signal. Only the best composite monitors include separate chrominance and luminance inputs. Commodore produced many fine monitors of this type, popular with Atari users.

Lonnie McClure provides this information on suitable Commodore monitors:
1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

The separate composite chrominance and luminance signals that the Atari puts out comprise what the world has since come to call Y/C video or S-video. S-video connectors are normally Mini4. It is possible to build a cable, or purchase several adapters, that can allow you to utilize the separate Y/C signals generated by the Atari with a television (or other display device) that provides a standard S-video Mini4 input jack. This is the ultimate display option for the 8-bit Atari. Clarence Dyson has a nice page about such a project at http://www.geocities.com/atarimods/svideo.html .

Adapters also exist that will take in composite video or s-video, and output a conversion of the signal as a standard VGA video signal. These are often known as a "VGA converter" or "Scan doubler" or "Up-converter." With such a device, the 8-bit Atari can be used with a standard PC VGA monitor. One such adapter is the Cheese Video Box from AV Toolbox, http://www.avtoolbox.com. AV

Toolbox produces several other similar devices. An earlier popular adapter was the JAM!! from AIMS Lab.

SCART - an acronym for Syndicat des Constructeurs d'Appareils Radiorecepteurs et Televiseurs - is a 21-pin universal connecting cable/socket system used for audio/video components in Europe. The cables transmit RGB, composite video, S-Video, mono and stereo sound. SCART, which is also known as PERITEL, EURO AV BUS and EUROCONECTOR, is common throughout Europe, particularly in France, England, Germany, Switzerland, and Scandinavia. SCART is also very popular in the Russian Audio Video market. It is possible to interface the Atari's composite video signal, along with the audio signal, through a SCART connector, though there have been few reports of people actually doing this.

Keith Howell has a nice page on some of these topics:
http://www.howell1964.freeserve.co.uk/Atari/800XL/Atari_800XL_Video.htm

December 2003--More Than Games announced "A8 A/V BOB", an audio/video breakout box featuring phono connectors for composite video, chroma, luminance, and mono audio; it also features an s-video jack providing chroma and luminance. http://www.a8maestro.com/sites/mtgcat/mtgcat.htm

---

Subject: 3.1) What are the Atari 410, 1010, XC11, and XC12 Program Recorders?

The Atari Program Recorders provide storage and retrieval of programs and data on cassette tape. In addition to the digital track that stores computer data, a second audio track is provided to play music or voice as the program runs.

Data transmission rate: 600 bits per second.
Data storate capacity: 100,000 bytes per 60-minute cassette.
Track configuration: 4 track, 2 channel (digital data and audio track)

410 Program Recorder
- early Japan version had a carrying handle
- most versions made in Hong Kong
- 410a--Taiwan version
- built-in SIO cable - must end SIO daisy chain
- power - plugs directly into wall (most versions)
- "410P" version (rare). Karl Heller writes:
"It came in the white 410 box with an Atari yellow/orange paper slip stating which power supply to use with it."

1010 Program Recorder
- Chelco version has Stop/Eject, then Pause buttons
- Sanyo version has Pause, then Stop/Eject buttons
- two SIO ports

XC11 Program Recorder
- has a built-in SIO cable and one SIO port

XC12 Program Recorder
- built-in SIO cable - must end SIO daisy chain

Upgrades for the Atari Program Recorders
==
Andreas Magenheimer writes: (2004.05.24)
- turbo 6000: a turbo tape enhancement built in the former GDR (german democratic republic); it worked with 6000 Baud and required special loading/saving programs that were available as disk-files and also as cartridges;
Information on the Turbo 6000 Baud Interface and the Chaos Loader:
http://www-user.tu-chemnitz.de/~sgl/atari/turb6000/turb6000.htm

- turbo 2000: a turbo tape enhancement built in Poland or the former Czechoslovakia; it worked with different speeds (ranging from 600 Baud to approx. 9600 Baud?) depending on the program itself and the transfer program; also required a special loading/saving program, available as disk-files and cartridges;
For more information on the Turbo 2000 (T2000) and SuperTurbo modifications to Atari program recorders, with speeds up 9600 baud, see
http://jindroush.atari.org

- rambit turbo tape: a turbo tape enhancement built in the UK by Richard Gore and sold by Microdiscount (Derek Fern); it worked with 9600 Baud and came with some special software on disk; Microdiscount also sold many of its own commercial programs (Zeppelin games, etc.) on Rambit turbo tape...

Subject: 3.2) What other cassette recorders can I use with my Atari?

Firstly Atari themselves put out several models beyond the 410/1010/XC11/XC12, generally only known in eastern Europe:

XCA12 Program Recorder -in same case as XC12...Poland
CA12 Program Recorder -in same case as XC12...Poland
image: http://romualdl.multimania.com/images/atari/ca12.jpg
XL12 Program Recorder -XC12 w/slight changed design. Czech/Slovak/Poland
XC13 Program Recorder -XC12 which was "T2000 ready". Czech/Slovak/Poland

Unlike other microcomputer systems of the time, it was very unusual to use anything but Atari-brand program cassette recorders. One third-party product released was the:

Compu-Mate, by General Electric (GE, G.E.)
Includes external interface module, a power cord/adapter, and SIO cable.
No second SIO port - must be at end of SIO chain.

Subject: 3.3) How do I run a program from cassette?

To run an Atari BASIC program from cassette:

1. Place the cassette in the recorder.
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position where the program is located.

3. Boot the computer to the Atari BASIC READY prompt.
4. There are several possibilities for the next step, depending on how the
program was saved, and whether you want to run the program or just load
it into RAM. Enter one of the following four commands:
a. CLOAD loads programs saved with CSAVE
b. LOAD "C:" loads programs saved with SAVE "C:"
c. ENTER "C:" loads programs saved with LIST "C:"
d. RUN "C:" loads&runs programs saved with SAVE "C:"

] Relative efficiency of the three cassette tape recording techniques:
] CSAVE/CLOAD - most efficient - fastest saves/loads - tokenized files
] SAVE "C:"/LOAD "C:" - middle efficiency - middle speed - tokenized files
] LIST "C:"/ENTER "C:" - least efficient - slowest - straight ATASCII

5. The computer will "beep" as a signal for you to press PLAY on the recorder.
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading has finished.
8. Unless you entered RUN "C:" above, now enter the command: RUN

To run an Atari BASIC or machine language program from cassette upon
startup:

1. Place the cassette in the recorder
2. Press REWIND of FORWARD, if necessary, to bring the tape to the position
where the program is located.
3. Turn on the computer while holding down the START key.
But if your computer has Atari BASIC built-in and you're running a machine
language program, hold down both the START key and the OPTION key.
4. The computer will "beep" as a signal for you to press PLAY on the recorder.
5. Let go of the START/OPTION button(s).
6. Press the RETURN key on the computer keyboard, and the program will load
into the computer.
7. Press STOP on the recorder when loading is complete and the program is
running.

Subject: 3.4) What are the Atari 810, 815, 1050, and XF551 Disk Drives?

Section includes contributions by Andreas Magenheimer, TXG.

The Atari Disk Drives provide storage and retrieval of programs
and data on 5.25" floppy disks.

==> Atari 810 --- a 5.25" floppy disk drive
The least common denominator for the Atari. One mode of operation:
1) Single-Sided, Single-Density--
FM 40 tracks x 18 sectors/track x 128 byte/sector = 90K capacity
19.2Kbps transfer rate. 288RPM.
The 810 includes a 6507 microprocessor.
Shipped with DOS 1 (very early) or DOS 2.0S
earlier MPI version- push button door opening for disk access

later Tandon version- lift door, like a garage door disk access
two SIO ports
accessories from Atari:
CX8100 Atari 810 Blank Diskettes (5 per box)
CX8111 Atari 810 Formatted Diskettes II (5 per box)
CX8202 Atari 810/815 Blank Diskettes (5/box, certified for double density)

Third-party upgrades for the 810:
810 Archiver -- copy many copy-protected programs
Happy 810 -- Happy Backup, Warp Speed 52Kbps, 18 sector buffer
810 Fast Chip by Binary 10%-40% faster
810 Turbo by Neanderthal Computer Things (NCT) -- double-density
see: http://www.qnet.com/~dons/810T.html
810 Duplicator (DT-Duplicating Technologies) -- copy disks, double-density,
"read 18 sectors in the time normally for 1"

==> Atari 815 Dual Disk Drive --- dual 5.25" floppy disk drives in one unit
Were produced (all hand-built), but are very rare. One mode of operation.
Per drive:
1) Single-Sided, Double-Density--
MFM 40 tracks x 18 sectors/track x 256 bytes/sector = 180K capacity
19.2Kbps transfer rate. 288RPM.
The 815 includes a 6507 microprocessor.
Shipped with DOS 2.0D
MPI mechanism version- push button door opening for disk access
Tandon mechanism version- lift door, like a garage door disk access
accessories from Atari:
CX8202 Atari 810/815 Blank Diskettes (5 per box, certified for double density)
Stephen Knox writes (12/28/02):
I believe the story on the 815s was Atari didn't want to release them due to
severe QA problems with the drive but they had so many preorders they had to
release something. I think they filled the preorders and then cancelled the
model - Most of them got returned due to problems.

==> Atari 1050 --- a 5.25" floppy disk drive
Same as the 810, plus Dual-Density capability. Two modes of operation:
1) Single-Sided, Single-Density, 90K, 810 compatible
2) Single-Sided, Dual-Density, otherwise known as "Enhanced Density" because
it is not true double-density--
MFM 40 tracks x 26 sectors/track x 128 bytes/sector = 128K capacity
19.2Kbps transfer rate. 288RPM
The 1050 includes a 6507 microprocessor.
Shipped with DOS 2.0S, DOS 3, or DOS 2.5
DIP switches: Black & white left: Drive 1
Black right, white left: Drive 2
Black left, white right: Drive 3
Black & white right: Drive 4
Third-party upgrades for the 1050 (all add a true SSDD 180K capability):
US Doubler (ICD) SS SD/ED/DD UltraSpeed (US) 54Kbps, sector skewing
Happy 1050 SS SD/ED/DD Warp Speed 52Kbps, 36 sector buffer,
(Happy Computers) Happy Backup. also read/write 180K 5.25" MS-DOS floppies

I.S. Plate (Innovated Software) SS SD/ED/DD Ultra/Warp (USD/Happy clone)
Hyper Drive (Chaos! Computers) SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Super Archiver (CSS) SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Super Archiver II(CSS)SS SD/ED/DD UltraSpeed 54Kbps (US Doubler clone)
Cheer-Up 1050 SS SD/ED/DD Warp Speed 52Kbps (Happy clone)
Speedy 1050 SS SD/ED/DD Warp Speed 57Kbps (Happy clone), 8kb buffer,
(Compy-Shop, now ABBUC) DOS, copier, track & density displays, beep speaker
Mini-Speedy same as Speedy 1050, but without displays & speaker
Super Speedy 1050 SS SD/ED/DD Warp Speed 96,000Baud (Happy clone),192K RAM
SuperMax 1050 SS SD/ED/DD UltraSpeed 52Kbps (US Doubler clone)
Lazer 1050 SS SD/ED/DD Warp Speed and UltraSpeed 54Kbps
Engl-Turbo-1050 SS SD/ED/DD Turbo Speed approx. 70,000 Baud (uses
(german Turbo) Sector skewing that differs from USDoubler)
1050 Duplicator (Duplicating Technologies (DT))
SS SD/ED/DD "read 18 sectors in the time normally for 1"
sources(Jim Patchell)http://www.oldcrows.net/~patchell/atari/duplicator.html
Klone ???????

Rich Mier professes:
You've been plugging and unplugging the SIO cable with the 1050 power pack
plugged in, right? That's a no-no. Most of the time it's Okay, but about 1
in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right,
rear of the main board. A 14 pin DIL chip. Actually it is an array of 5
transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be
ON on the CPU. The problem has to do with the secondary winding of the Power
Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do
it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it
'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it
won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

==> Atari XF551 --- a 5.25" floppy disk drive. Four modes of operation:
1) Single-Sided, Single-Density, 90K, 810 compatible
2) Single-Sided, Enhanced-Density, 128K, 1050 compatible
3) Single-Sided, Double-Density, 180K, Percom & other 3rd parties compatible
4) Double-Sided, Double-Density--
MFM 80 tracks x 18 sectors/track x 256 bytes/sector = 360K capacity
Writes "backwards" to the second side of the disk, when compared to a two-
sided "flippy" disk with SSDD 180K format on each side
High speed 38400 bps burst mode usable only with SpartaDOS X, SuperDOS 5.1,
TurboDOS, DOS XE, and patched SpartaDOS 3.2.
Rotaton rate: 300RPM. Since all other Atari-specific drives run at 288RPM,
this results in rare compatibility issues. Specifically, these commercial
disks do not load in, and can be damaged by, the XF551:
- Flight Simulator II (subLOGIC)
- Blue Max (Synapse)
- Bank Street Writer (Broderbund). Conflicting reports about this one.

8040 cpu + external ROM or 8050 cpu with internal ROM
Shipped with DOS 2.5 or DOS XE.
DIP switches: Both dips down: Drive 1
Left down, right up: Drive 2
Left up, Right down: Drive 3
Left and Right up: Drive 4
Chinon-built XF551-cannot read/write/format backside if no timing hole
Mitsumi-built XF551--can read/write backside if to timing hole, if formatted
Third-party upgrades for the XF551:
CSS XF Single Drive Upgrade--3.5", 720K floppy drive replacement
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFsingdrup.htm
CSS XF Dual Drive Upgrade--add 3.5" drive w/o losing the 5.25" drive
also read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFdualdrup.htm
CSS XF551 Enhancer--overcomes sensor for index hole, create flippy disks
see http://www.nleaudio.com/css/products/XF551enh.htm
CSS XF Update--replace drive OS, adds UltraSpeed
see http://www.nleaudio.com/css/products/XFupdate.htm
Hyper-XF-OS--avaiable for 5.25" or 3.5" floppy versions; uses sector skewing
and UltraSpeed (but no track buffer!); can use disk partitions
(2 on 5.25", 4 partitions on 3.5") with mixed Densities (S/E/D)
or standard 360kbytes (5.25") / 720kbytes (3.5"); can
theoretically read/write ST/PC 720k disks (software is missing!)
OS created by Stefan Dorndorf/Germany;
XF-Speedy--replaces the 8040 CPU with a 65C02 + ROM + Memory

Subject: 3.5) What other floppy disk drives can I use with my Atari?

Major contributors to this section: Glenn M. Saunders, Tomasz M. Tatar,
James Bradford, Konrad M. Kokoszkiewicz, Don Schoengarth, Andreas
Magenheimer

SD=Single-Density, 90K/disk side
ED=Enhanced-Density, 128K/disk side
DD=Double-Density, 180K/disk side

SS=Single-Sided
DS=Double-Sided (one of 3 possible data-mappings, see below for details)

Printer port=has a standard DB25 parallel printer port,+ maybe a print buffer
Master=includes drive controller, can add additional,non-Atari-specific drives

Top transfer rate=19.2Kbps unless stated otherwise

Floppy disk drives designed for the 8-bit Atari computers:
Atari 810 SS SD
Atari 1050 SS SD/ED
Atari XF551 DS SD/ED/DD, 38.4Kbps burst mode
Access Unlimited ATAR88-1 SS SD master
Access Unlimited ATAR40-1 SS SD/DD master

Amdek AMDC I SS SD/DD uses flippy Amdisk III 3" disk/carts,printerport,master
Amdek AMDC II SS SD/DD dual drives, printer port, master
AS SN-360 DS SD/ED/DD
Astra 1620 SS SD/DD dual drives
Astra 2001 SS SD/DD dual drives
Astra Big-D DS SD/DD dual drives
Astra The One DS SD/DD, printer port
B&C 810 SS SD, optional Happy Warp Speed 52Kbps
Concorde C-221M SS SD/DD master
Concorde C-222M DS SD/DD master
CSS Floppy Board, for the Black Box, master, support PC 720K and 1.44MB 3.5"
drives, support PC 1.2MB and 360kB 5.25" drives,
also read/write 5.25" and 3.5" MS-DOS disks
see: http://www.nleaudio.com/css/products/floppy.htm
High-Density Disk Interface (HDI) by Erhard Puetz. a PCB, master
connect up to 4 standard PC high-density drives
Indus GT SS SD/ED/DD, Synchromesh mode usable with SpartaDOS X
and DOS XL only. 72Kbps under SpartaDOS X, 37Kbps under DOS XL. Z-80 cpu
RAM-Charger--expansion card contains 64K RAM + software, for CP/M support
Karin Maxi PBI/ECI device, master, WD1772 + 2KB driver ROM
DS formats use PC-standard 'head-first' mapping
L.E. Systems LEDS5-01 SS SD/DD master, 134.4Kbps, 800 only
CP/M expansion: 4MHz Z80, 64K RAM
L.E. Systems LEFDC-04 SS SD Four drives, copies a disk in 22 secs, 800 only
L.E. Systems LEFDC-08 SS SD Eight drives, copies a disk in 22 secs, 800 only

(80-track RFDs hinted at http://www.atarimagazines.com/v1n2/newproducts.html)
Percom AT88 SS SD, master
Percom AT88-S1 PD SS SD/DD, printer port, master
Percom AT88-S2 PD SS SD/DD dual drives, printer port, master
Rana 1000 SS SD/ED/DD, stand alone disk formatting
RCP 810 SS SD
San Jose Computer Special Edition 810 SS SD, optional Happy Warp Speed 52Kbps
SWP ATR8000 4MHz Z80, 16K RAM, RS232, master, printer port
or 4MHz Z80, 64K RAM, RS232, master, printer port, CP/M 2.2
options: 128K or 256K CO-POWER-88 with MS-DOS; CP/M-86
TOMS 720 DS SD/ED/ID/DD/QD/ID printer port, MYDOS 4.50 on ROM, 70Kbps
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB

- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
- known as Toms-Turbo Drive, Turbo format and speeder is compatible
with german Engl-Turbo-1050; (tools will work with both drives);
TOMS 710 DS SD/ED/ID/DD/QD/ID printer port, MYDOS 4.50 on ROM, 67Kbps
one more format: double sided, 80 tracks, IBM (720 KB)
also TOMS Navigator on ROM (like Norton Commander);
known as Toms-Turbo drive; Turbo format and speeder is compatible
with german Engl-Turbo-1050; (tools will also work with both drives);
Trak AT-1 SS SD/DD master.upgrade: printer port+4K/16K buffer
Trak AT-D1 SS SD master, printer port, 4K print buffer.upgrade:16K
Trak AT-D2 SS SD/DD master, printer port, 4K printbuffer.upgrade:16K
Trak AT-D4 DS SD/DD, printer port, print buffer
Trak Champ SS SD master
Trak Champ2 SS SD/DD master
Trak AT-S1 SS SD/DD slave
XFD601B DS SD/ED/DD 70kbps,Top Drive,Synchromesh,UltraSpeed,XF551 compat.
XFD602B dual DS SD/ED/DD 70kbps,Top Drive,Synchromesh,UltraSpeed,XF551 compat

While any standard "slave" drive will work with "master" drives listed above,
the following are slave drives marketed specifically to Atari users:
Access Unlimited ATAR88-A1 SS SD slave
Access Unlimited ATAR40-A1 SS SD/DD slave
Concorde C-221S SS SD/DD slave
Concorde C-222S DS SD/DD slave
Percom RFD40-A1 SS SD/DD slave
Percom AT88-A1 SS SD/DD slave
RCP 100 DS SD/DD, slave
RCP 200 DS SD/DD dual drives, slave

The following information is taken from the documentation for HiassofT's
WriteAtr program, http://www.horus.com/~hias/atari/

Double-Sided drives for the Atari may use one of three different drive-
mapping possibilities.
* Most double-sided Atari disk drives:
First fill tracks 0-39 (or 0-79) on the first side, then switch
over to side 2 and again fill tracks 0-39 (0-79 for 3.5" disks).

* The XF551 first fills track 0 on the first side. Then it
fills track 1, then track 2, ... up to track 39 (on a 5.25" disk)
or 79 (on a 3.5" disk). Then it switches to side 2 and fills
the disk in reverse order (starting at track 39/79, then 38/78,
... til it has reached the end of the disk at track 0).

* The third possibility is the standard in the PC world, but on the Atari
it's possibly unique to drives connected via the Karin Maxi interface.
If your Atari disk drive uses this mapping, it first fills

track 0 on side 1, then track 0 on side 2, then seeks to track 1,
again first fills track 1 / side 1, then track 1 / side 2,
and so on, until it finishes with track 39 (79) / side 2.
The drive switches the heads (sides) first before switching
the track.

Subject: 3.6) What kinds of 5.25" floppy disks can I use with my Atari drives?

Russ Gilbert writes:
If you're talking standard computer store, you can't use those 5 1/4" disks. I mean you can't use high density disks. They must be double density to use with the 1050. Almost all double density 5 1/4" disks have a hub ring, high density disks don't have the hub ring.

RHamiIton5 elaborates: (5/12/01)
The Atari 8 drives do not have write heads and circuity which can handle the type of oxide coating used on the high density floppy media; they cannot write reliably to them. The hub ring has just become a sort of marker to distinguish the high density from the standard double density diskettes.

Way back in your apple days of '79-'82, most disks were hubless and only the really premium brands offered hubs to prevent slippage and out of round problems; you could even buy little kits for adding you own hub rings.

When the home computer swell really hit around '83 and price wars began, hub rings became common on good disks and eventually became standard down to include most generic bargain diskettes.

The introduction of high density 5.25's required a different coercivity (= magnetizability) to get more bits in a smaller space and suitable electronics to do it. These disks were produced hubless; was it a differentiating label or just unnecessary because of stronger mylar construction? Anyone?

Subject: 3.7) What can I do to extend the life of my floppy disks?

Lee Hart writes (January 2004):

Personally, I have several hundred floppy disks for my Atari 800, Kaypro 4, Heathkit H89, and IMSAI 8080 computers that are 10-20 years old. What I can say in general:

- Most disks stored in plastic boxes or ziplock baggies survived.
- Most disks stored in cardboard boxes or just their sleeves did NOT survive.
- Some brands lasted better than others, but I haven't collated the information so as to make any kind of definitive statements.
- If a disk cannot be read, CLEAN THE DISK DRIVE HEAD before attempting to read another disk! Otherwise, crap from the bad disk will remain on the head, and will scar and destroy any SUBSEQUENT disk you put in the drive! (the voice of painful experience).

- For lack of a better plan, for each of my surviving disks I am:
a. reformatting another blank disk
b. copying the data from an old disk onto the blank disk
Then I have a more recently-produced backup disk in case the
original disk later fails.

Subject: 3.8) How can I use a hard drive with my 8-bit Atari?

Atari never produced hard drives for the 8-bit Atari, but a variety of options have been produced over the years. No common DOS version was written with drives the size of hard drives in mind, and very few 8-bit Atari users have owned hard drives for the Atari. Yet, if you're serious about it, a hard drive can make a tremendous addition to your system!

A couple of these options are hard drives designed specifically for the 8-bit Atari computers; the rest are interfaces designed to let you attach an industry standard SASI, SCSI, or IDE type hard drive. Customized software (OS, DOS) is often involved as well.

Larry White contributed to some of these descriptions.
Additional Corvus info from an eBay auction by Ben Corr, 7/03.

==> Corvus hard drive (5MB, 10MB, or 20MB)
Attaches via joystick ports 3 & 4 on the Atari 800 only.

-- Corvus Integrator Board - alows access to the Corvus Disc without the Corvus software, so that any DOS that uses standard SIO calls will work.

-- Corvus Multiplexer - used to network up to 8 Ataris to one Corvus Drive

- Corvus Mirror card - back up the drive's contents onto video tape

==> SupraDrive Atari Hard Disk, by Supra, later K-Products. 10MB or 20MB.
includes external Hard Disk Interface
Some limitations on drive type and size and total number of drives in sys.
Attaches via PBI, or ECI with adapter.
See: http://www.atarimagazines.com/v5n6/Supradrivefor8Bit.html
Maybe still available from Bob Klaas?

==> BTL Hard Disk System
BTL 2001 Connector for 600XL/800XL PBI
BTL 2002 Connector for 130XE/800XE/65XE ECI
BTL 2004 SASI Hard Disk Adapter
See: http://www.atarimagazines.com/v5n12/BTLHardDisk.html

==> Multi I/O (MIO) interface, by ICD. Includes:
- Parallel printer interface
- Serial interface, for modem or serial printer. will handle 19.2Kbps
- 256K or 1 MB RAM, for RAMdisk or printer spooler
- SASI/SCSI interface, supports up to 8 controllers.
Limited to drives with 256-byte sectors.
Attaches via PBI, or ECI with adapter.

==> CSS Black Box interface
RS-232 Serial Modem Port (19.2Kbps) w/ hardware flow control,
Parallel Printer Port,SASI/SCSI Hard Disk Port, Operating System Enhancements,
optional 64K printer buffer. Supports drives with 512-byte sectors.
PBI/ECI device. Available: http://www.nleaudio.com/css/products/black.htm

==> SmartIDE project by Bob Woolley
Uses 256 of the normal 512 byte sectors. Point-to-point wiring project.
Articles and software at http://www.geocities.com/atarimods/atari.html
(Atari page by Clarence Dyson)

==> IDE Hard Drive Interface 1.0
By Konrad M. Kokoszkiewicz (Draco) and Jacek Zuk
PBI device. Logical sector length: 256 or 512 bytes
Availability???

==> Fine Tooned Engineering (FTe) Multi I/O II (MIO II) interface
An IDE interface. Several exist, but it was never really released

==> msc-IDE Controller
created by Steve Birmanns and Matthias Belitz
* real device for the parallel-port (PBI/ECI) of the Atari XL/XE
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* software partially supports CD-ROM and ZIP drives.
Sold out.
http://www.birmanns.de/atari/

==> Gary Morton's BadSector"A" Project
Wants to connect his IDE drive to the SIO bus.
http://www.alma.demon.co.uk/Atari/AtariProjects.html

==> MyIDE interface and software by Mr.Atari, Sijmen Schouten
Point-to-point wiring project. Different units for 800 and XL, including a
cartridge version for the XL.
http://home.wanadoo.nl/mr.atari/

==> SIO2IDE, by Marek Mikolajewski (MMSoft)
The SIO2IDE is a simple interface that allows you to attach any IDE
Disk Drive to your 8-bit Atari computer. Latest interface version has the
following main features:

* ATARI side:
- uses standard Atari SIO at a speed of 19200 baud
- works with Atari High Speed SIO (US and Happy) at a speed of 52000
baud
- emulates Atari disks D1: to D8:
disk D1: can be swaped with Common disk D1: (HD1_ZW jumper)
- can be used with any Atari DOS and OS

- can be used without any problems with other SIO devices (disk
drivers, printers, modems, SIO2PC, second SIO2IDE etc)
- can be easy installed inside your Atari with 2.5' laptop HD
- is easy to configure via special fdisk.com utility software
(changing disks sequence and active directory)
* IDE device side:
- all IDE ATA/ATAPI devices can be used: Disk Drives (2.5' and 3.5'),
CD-ROMs, Compact Flash cards etc.
- supports PC file systems, FAT16 and FAT32
- supports CD file system, ISO9660
- supports ATR disk images (SD, DD up to 16MB)
- supports directory change (multiconfig)
- is easy to configure, many text configuration files (sio2ide.cfg)
can be stored in different directories
- disk configuration can be checked by special checkfs.exe PC utility
NOTE: checkfs.exe does NOT work with HDD connected via USB port
- standard disk utilities can be used (defrag.exe, scandisk.exe etc)
- Long File Name (LFN) support for HDD
- TEST mode for checking HDD initialisation
* USB port side:
- interface works as Mass Storage Class device (removable drive)
- no drivers are needed for Windows 2K, ME, XP
- driver for Win98 is included in this SIO2IDE package

http://atariarea.histeria.pl/sio2ide/

==> Nathan Hartwell's IDE projects
http://www.magelair.com/

Subject: 4.1) What are the Atari 820, 822, and 825 Printers?

The following printers were produced by Atari and styled to match the 400/800
computers.

Atari 820 Printer:
- 40-column impact printer
- 5x7 dot matrix
- 40 characters per line, upper & lower case alpha
- horizontal and vertical alphanumeric characters
- 6507 microprocessor, 6532 RAM I/O chip, 2K ROM
- 40 characters per second
- uses Standard Roll Paper/adding machine paper

Atari 822 Thermal Printer: (= Trendcom Model 100)
- 37 characters per second
- 10 characters per inch
- 40 characters per line, upper/lower case and point graphics
- 5x7 dot matrix

Atari 825 80-Column Printer (= Centronics 737)
- 3 character sets:

monospaced 7x8 dot matrix at 10 characters per inch
monospaced condensed at 16.7 cpi
proportionately spaced Nx9 dot matrix at avg of 14 cpi (N=6..18)
- all characters can be elongated (printer double width)
- characters per line: 80 at 10 cpi; 132 at 16.7 cpi
- speed: 50 cps at 10 cpi; 83 cps at 16.7 cpi; 79 cps avg. proportional
- print buffer: 1200 dot columns
- paper: roll, fanfold, or cut sheets
- requires Atari 850 Interface Module or equivalent

Subject: 4.2) What are the Atari 1020, 1025, 1027, and 1029 Printers?

The following printers were produced by Atari and styled to match the XL
series computers.

Atari 1020 Color Printer:
(= Commodore 1520 / Oric MCP40 / Tandy/Radio Shack CGP-115 /..; made by ALPS)
- 4-color graphics: (black, red, blue, green). optional 8-pen rainbow package
- alphanumberics and X,Y plotting capability
- 10 cps (40-column mode)
- 20, 40 and 80-column modes
- horizontal and vertical alphanumerics, English and International chr sets
- water soluble ink pen technology
- 4-pen barrel print head
- microprocessor
- paper: standard roll paper (40 column width)
- AtariGraphics cassette software included

Atari 1025 80-Column Printer: (= Okidata ML80)
- 40 cps (80-column 10 cpi mode)
- 5 cpi expanded (40 col), 10 cpi (80 col), 16.7 cpi condensed (132-col)
- 5x7 character dot matrix
- buffer: 132 chrs at 16.7 cpi, 80 chrs at 10 cpi
- paper: roll,fanfold,single sheets. optional:roll paper holder, tractor feed

Atari 1027 Letter Quality Printer: (= Mannesmann Tally Riteman LQ.)
- fully formed characters, prestige elite 12)
- 12 characters per inch (80 columns)
- 20 characters per second
- single sheets or roll paper

Atari 1029 Programmable Printer (by Seikosha)
- 7-pin dot matrix, same as Commodore MPS-801
- Released for Europe & Canada (not USA)
- Rich_N_Feymus says:
I think its a SEIKOSHA GP500, but not 100% sure. However, the
Commodore MPS-801 ribbons should be much easier to find.
- The Tandy DMP 110 is another model reported to be the same as the 1029.

Subject: 4.3) What are the Atari XMM801 and XDM121 Printers?

The following printers were produced by Atari and styled to match the XE series computers.

Atari XMM801 Printer: (= SHINWA CP80)
- 80 columns, dot matrix
- friction feed or pin feed
- pica 10 cpi, double width pica 5 cpi, elite 12 cpi,double width elite 6 cpi, condensed 16.5 cpi, double width condensed 8.25 cpi
- Ribbon: Commodore 1526 and the Mannesman-Tally Spirit 80

Atari XDM121 Printer:
- 80 column, daisy wheel--letter quality
- underlining, subscripts, superscripts
- friction feed paper
- Ribbon: Silver Reed CF130, Olivetti ET201,ET221,Nu-Kote NK136

Subject: 4.4) What other printers can I use with my Atari?

Some third-party printers were marketed for use with the Atari 8-bit computers:

Alphacom 42 + Atari interface cartridge
- requires 850 Interface or equivalent
- thermal
- 4 1/2" width paper
- supports complete ATASCII character set

Axiom AT-100 / Seikosha AT-100 / Seikosha GP-100A Graphic Printer
- built-in Atari interface, cable and connector, 2nd SIO port for daisy-chain
- dot matrix
- early model 30-cps, later version 50 cps
- Graph-AX graphics software package

Axiom GP-550AT (by Seikosha)
- built-in Atari interface, cable and connector, 2nd SIO port
- dot matrix
- 86 cps draft, 43 cps NLQ
- Graph-AX graphics software package

Axiom GP-700AT (by Seikosha)
- built-in Atari interface, cable and connector, 2nd SIO port
- 4 hammer print heads, 4-color ribbon cartridge
- 25 colors
- 50 cps
- Graph-AX graphics software package

Epson HomeWriter 10
- plug-in cartridge interface for the Atari
- 80 column dot-matrix printer
- draft quality printing at 100 cps and near letter quality at 16 cps

General Electric GE 3-8100 / TXP 1000
- GE Printer Interface Module for Atari
- dot-matrix
- 50 cps draft, 25 cps NLQ

Okidata Okimate 10 Personal Color Printer
- available Plug 'n Print Interface for Atari
- a thermal printer.
- single-sheet or tractor-feed paper.
- 26 colors
- 240 words per minutes

Beyond the above printer models, most any "industry-standard" line printer can work well with the Atari. For many years, most printers marketed for home use could be classified into one of two categories: parallel or serial interface. Parallel line printers are much more commonly used than serial line printers, with the Epson MX/FX/LX series defining the market.

The most common way to use an industry standard printer with the Atari has been to attach it through the 15-pin 8-bit parallel port of the Atari 850 Interface Module or equivalent (such as the ICD P:R: Connection). One gotcha here is that the 850's parallel port is DB15, where the PC world ended-up standardizing on a DB25 configuration. So you need to find or build a cable that provides the DB15 connector for the Atari end (and Centronics-type parallel connector on the printer end) when attaching a standard parallel printer to the Atari through an Atari 850 or equivalent.

Many 3rd-party disk drives for the Atari (along with the XEP80 Interface Module) do include a DB25 parallel printer port, rendering the need for an Atari-specific printer cable unnecessary.

The Atari 850 Interface Module and equivalents also provide standard DB9 serial RS232C ports, permitting use of standard serial line printers with the Atari. But this is much less common than parallel, both in the Atari world and in the industry at large.

Some folks have connected more modern inkjet and laser printers with parallel connections to the 8-bit Atari with success. Graphics printouts from the Atari may be less than ideal (look for a printer with an Epson MX/FX/LX printer series emulation mode), but these types of printers should work fine for plain text output if they can handle simple line print jobs. Anyone want to contribute their experiences to be included here?

Bob Woolley wrote on Sun, 14 Apr 2002:
I use HP LaserJet 4Ps on my Ataris. They are one of the last front panel selectable cheap printers - from which you can select your default fonts, etc. The newer laser printers can only set fonts and operating modes thru the interface, not impossible, but not as easy as selecting on the panel. This does allow you to print just about any point size of the internal fonts in the printer on your Atari.

Either way, you really have to do a little work to get properly formatted output from a word processor. I have managed to use the proportional font setting with AtariWriter and printer driver creation utilities to get good

results.

Mathy van Nisselroy provides an AtariWriter printer driver for the HP LaserJet
here: http://www-users.rwth-aachen.de/mathy.van_nisselroy/stuff.htm

Modern printers designed for home markets now tend to provide USB connectors.

Subject: 5.1) What are the Atari 830, 835, 1030, XM301, and SX212 Modems?

A MODulator/DEModulator translates digital information from your computer into
acoustic tones that can be sent and received, from modem to modem, via
standard telephone lines.

Atari produced several modems for use with the 8-bit Atari computers:

Atari 830 Acoustic Modem: (= Novation 'CAT')
- a stand-alone, acoustically coupled, frequency shift keying (FSK) modem
- up to 300 bits per second
- Bell 103/113 modem compatible
- requires Atari 850 Interface Module or equivalent

Atari 835 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible

Atari 1030 Direct Connect Modem:
- 300 bps
- Bell 103/113 modem compatible
- built-in ModemLink software.
- 2 SIO ports

Atari XM301 Modem:
- 300 bps
- Bell 103/113 modem compatible
- with XE Term disk software
- permanent SIO cable, must be at end of SIO chain
- draws its power from the computer via SIO

Atari SX212 Modem:
- SIO & DB25 RS232 serial ports, must be at end of SIO chain
- 1200 baud
- Bell 103/113/212A modem compatible
- rarely with SX-Express! disk software.

Subject: 5.2) What other modems can I use with my Atari?

Some third-party modems were marketed for use with the Atari 8-bit
computers:

==> Microconnection, by Microperipheral Corp.
300 bps, Bell 103 compatible, T-SMART software, pulse dialing (not touch tone)

Four versions:
buss-decoding version does not require 850 Interface or equivalent, includes
DB25 parallel printer interface, with or without autodial
Plain version requires 850 Interface or equivalent, with or without autodial
and autoanswer

==> MPP-1000C, by Microbits Peripheral Products
300 baud, joystick port 2, Smart Terminal cartridge

==> MPP-1000E, by Microbits Peripheral Products
300 baud, joystick port 2, Smart Term software
From: "Steven J Tucker" Sun, 13 Jan 2002 16:14:38 -0500
The 1000E..had this strange problem in that it could never hang up the phone

==> MPP-1200A, by Microbits Peripheral Products
Released? Vaporware?
1200 bps, joystick port 2

==> 300 AT, by Supra (same as MPP-1000E)
300 baud, joystick port 2, Smart Term software

==> 1200 AT, by Supra
1200 baud, Hayes compatible, connects to SIO via SupraVerter/R-Verter cable,
Smart Terminal software

==> Volksmodem, by Anchor Automation
300 baud, 'F' Cable permits connection to joystick port 2

==> Q-MODEM, by Quantum Microsystems
300 baud, two SIO connectors, QuanTerm disk or cartridge

Beyond the above modem models, most any "industry-standard" external serial modem can work well with the Atari. These have been commonly sold for PCs for many years. The Hayes Smartmodem more or less defined the market for these, initially.

One common way to use an industry standard external serial modem with the Atari is to connect it to the SIO port via an Advanced Interface Devices (A.I.D., later Supra) R-Verter Serial Bus Modem Adapter cable, or equivalent.

The other common way to use an industry standard external serial modem with the Atari is to attach it through the 9-pin RS232C serial port of the Atari 850 Interface Module or equivalent (such as the ICD P:R: Connection). One gotcha here is that the serial port on the 850 is DB9 female, where the PC world ended up standardizing on a DB9 male connector for this purpose. But gender converters are readily available.

For using modems at speeds of 2400 bps and up with the Atari, it will be useful to have an understanding of data flow control. Here is a definition of flow control from www.modems.com:

Often, one modem in a connection is capable of sending data much faster than the other can receive. Flow control allows the receiving modem to tell the

other to pause while it catches up. Flow control exists as either software, or XON/XOFF, flow control, or hardware (RTS/CTS) flow control. With software flow control, when a modem needs to tell the other to pause, it sends a certain character, usually Control-S. When it is ready to resume, it sends a different character, such as Control-Q. Software flow control's only advantage is that it can use a serial cable with only three wires. Since software flow control regulates transmissions by sending certain characters, line noise could generate the character commanding a pause, thus hanging the transfer until the proper character (such as Control-Q) is sent. Also, binary files must never be sent using software flow control, as binary files can contain the control characters. Hardware, or RTS/CTS, flow control uses wires in the modem cable or, in the case of internal modems, hardware in the modem. This is faster and much more reliable than software flow control.

Some 2400 bps modems, and probably all modems with 9600 bps speed capabilities and up, normally use V.42 standard error correction and V.42bis standard data compression. But V.42 requires either software or hardware flow control, and V.42bis requires hardware flow control (and V.42 error correction).

Hardware flow control is not available with the Atari 850's serial ports.

As a result, just before dialing out with your Atari telecom software, it's usually desirable, if not necessary, to disable your modem's flow control.

The Hayes modem command to disable flow control looks like:
AT&K0

The top speed of the Atari 850's serial ports is 9600 bps.

Clay Halliwell offers a tip on utilizing 9600 bps through the 850 Interface:
On 11 Feb 1996, Marc G. Frank said:

> I'm having problems getting a modem attached to my Atari 850 to
> communicate at 9600 baud. When I set my communications program to 2400
> baud, everything works fine. However, when I set it to 9600 baud, the
> modem echoes my characters but doesn't act on them. That is, at 2400,

The problem with the 850 is that some of them (like mine) don't produce a PERFECT 9600 baud signal. As a result modems can't train on it, and while they will echo characters back, for some nitpicky reason they won't pick up on the "AT" attention code.

The solution is to do all your dialing at 2400 baud, but set the S37 register to force the modem to try to connect at 9600. Then switch your Atari to 9600 after connecting.

Through the use of an ICD MIO or a CSS Black Box, it is possible to utilize modems at speeds up to 14.4 Kbps (V.32bis) at full speed with no loss of data. The serial R: device handler for the Black Box supports hardware flow control natively. Optional for the Black Box, but essential for the MIO, is the HyperSpeed handler by Len Spencer.

Hyperspd.arc is available at http://members.aol.com/lenspencer/atari8.htm

---

Subject: 6.1) What is the Atari 850 Interface Module?

While the Atari's SIO and controller ports did not conform to established industry standards, Atari produced the 850 Interface Module to address this issue. The 850 connects to the SIO port on the Atari, and provides:

- four 9-pin serial EIA RS232C ports
- One 15-pin 8-bit parallel Centronics-type port

Many "industry standard" (of the time) printers, modems, and various other devices can be used with the Atari computer in combination with an 850 Interface Module.

Early 850's are in an all metal (black) case, but most are in a plastic beige case matching the 400/800 computers. Other features:
- programmable baud rate on any port, including:
75, 110, 134.5, 150, 300, 600, 1200, 1800, 2400, 4800, and 9600 bps;
baudot speeds of 60, 66, 75, 100 words per minute
- uses standard ASCII. Baudot support for radio-teletype (RTTY).

Because the 850 was relatively expensive, provided more capabilities than the average user was looking for, and was at times unavailable from Atari despite high demand, there were many 3rd-party interfaces designed to provide some compatible subset of the 850's features. Perhaps the most prominent example of such a product is the P:R: Connection from ICD.

Subject: 6.2) What is the Atari XEP80 Interface Module?

This text written by Thomas Raukamp.

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from David A. Paterson.

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on

the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;)).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 6.3) What accessories did Atari produce for their 8-bit computers?

This should be a complete list of Atari "CX" accessories, two or three digit numbers, marketed for use with the 8-bit computers.

CX30-04 Paddle Controller Pair
CX40-04 Joystick Controller Pair
CX40 Single Joystick Controller
CX41 Joystick Repair Kit
CX22 Trak-Ball Controller
CX23 Kid's Controller
CX24 Pro-Line Joystick
CX42 Remote Control Wireless Joysticks

CX50 Keyboard Controller Pair
CX70 Light Pen (beige; the original Atari light pen)
CX75 Light Pen (+ Atarigraphics cartridge)
CX77 Touch Tablet (+ AtariArtist cartridge)
CX78 Joypad (shipped with the 7800 in Europe)
CX80 Trak-Ball
CX81 I/O Data Cord (5 ft)
CX82 Monitor Cable (Black and White Monitor)
CX85 Numerical Keypad (+ software Handler on diskette)
CX86 Printer Cable (included with 825 Printer)
CX87 Interface/Modem Cable (included with 830 Acoustic Modem)
CX88 Interface/Terminal Cable (null modem)
CX89 Monitor Cable (Color Monitor)
CX418 The Home Manager Kit (Personal Financial Management, Home Filing Manager
-or- Family Finances, The Home Filing Manager)
CX419 The Bookkeeper Kit/Atari Accountant (The Bookkeeper disk, CX85 keypad)
CX481 The Entertainer (Star Raiders, (Missile Command or Pac-Man),2 joysticks)
CX482 The Educator (410, BASIC cart., States & Capitals cassette)
CX483 The Programmer (BASIC, BASIC Ref. Manual, BASIC Self-Teaching Guide)
CX484 The Communicator (850, 830, TeleLink I cart.)
CX488 The Communicator II (835, TeleLink II cart.)
????? The Arcade Champ (Pac-Man, Qix, 2 joysticks, cartridge storage case)
????? The BASIC Tutor I (Inside Atari BASIC bk,Invitation to Programming 2&3)
CX852 8K RAM Memory Module (for 800 computer)
CX853 16K RAM Memory Module (for 800 computer)
XG-1 Light Gun (+ Bug Hunt cart.)

Subject: 6.4) What "vaporware" computers/peripherals were never released?

Atari was a HUGE company, dominating Silicon Valley, and included a massive
research and development department which famously designed many, many
products that never saw the light of day. Here is a brief listing of many
Atari hardware model designations known to have existed internally to the
company, but which were never sold and are extremely rare (if they ever
existed at all). For definitive information on unreleased Atari products,
see:

Atari Historical Society, http://www.atari-history.com/ (Curt Vendel)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XL brown prototype
800XLD low-cost 1450XLD,no modem&speech,incl disk drive controller&FREDDIE
800XLCR Cost Reduced, with CGIA chip ("Keri"), which is a combined GTIA&ANTIC
900XLF early name for 65XE

1250XLD Earlier name for the 1450XLD
1400XL brown prototype
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives(controller not included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard
1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMY sound chip

Atari 8-bit vaporware peripherals: (note some are more vaporous than others)
1027 PLUS -daisy-wheel, 80 columns
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80col display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor (Goldstar)
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 6.5) What are the power requirements for my Atari components?

Thanks to Matthias Belitz for the European data in this section. I need more
international help!

As with the rest of this FAQ list, please let me know if any of this
information conflicts with the units you have.

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output).
The power (in voltamps or watts) and current (in amperes) specifications
of the original equipment as presented here should be regarded as
minimum values. Higher-than-specified power and current capacities are
entirely usable, and often preferable because such supplies run cooler
and last longer.

Direct Current (DC):
Power (in watts) = current (in amps) * voltage (in volts)

Alternating Current (AC):
Apparent Power (in voltamps) = current (in amps) * voltage (in volts)
Effective/True Power (in watts) = current (in amps) * voltage (in volts)
* (cosine of the angle of lag)

N O R T H A M E R I C A INPUT = 115-120 V AC, 50/60Hz

MPP1000C modem: 9 V DC 200 mA (1.8 W)

Subject: 6.6) What graphic tablets were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Touch Tablet by Atari (came with Atari Artist cart., Micro Illustrator compatible),
- Koala Pad by Koala Industries (came with Koala/Micro Illustrator cart.);
- Powerpad by Chalkboard Inc. (came without software!); the following carts were available separately for the Powerpad: Micro Illustrator, Leo's Lectric, Micro Maestro, The Programmers Kit, Logic Games, Bear Jam (as refered to Antic, September 1984);
- Animation Station by Suncom (came with Micro-Illustrator cart.);

Subject: 6.7) What lightpens were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Lightpen (came with Atari Graphics cart.; it produces pictures with 127 sectors in length, thus not Micro-Painter, nor Micro-Illustrator compatible; however appropriate converter programs can be found in the public domain, e.g. the Rapid Graphics Converter);
- Edumate Lightpen (came with a disk with 6 Basic programs; a program called Peripheral Vision was available separately from Future House);
- Tech-Sketch-Lightpen (came in two versions: a) the cheaper version which included a disk with Basic programs only and b) the more expensive version which included the disk with Basic programs and the Micro-Illustrator cartridge);
- MC-Pen-Lightpen (came with a disk with 4 Basic programs);
- Reston Lightpen (came with ???);

Note: these infos were taken from Antic, September 1984; I am not sure, if all these items were really available as listed...

Subject: 6.8) What lightguns were produced for the Atari?

This section by Andreas Magenheimer.

- Atari LG-1 Lightgun (came in two versions: a) complete with XEGS, keyboard, joystick, power supply, tv-cable, Lightgun, FS II cart and

Bug Hunt cart all in one package and b) in a separate package,
containing the Lightgun and the Bug Hunt cartridge); thats's why Bug
Hunt does not have its own package, it was always included with the
Lightgun package and/or the complete XEGS package...
- BEST Lightgun by Best Electronics (a sort of selfmade (?) Lightgun);
- Sega-Lightgun (normally not Atari compatible; but can be converted
into an Atari compatible lightgun easily);
- other lightguns (most of these have to be converted)...

Note: After having 3-4 Atari and at least one (converted) Sega lightgun,
it is my personal impression, that the Atari lightgun merely works ok
on/with TV-sets (and not at all with a monitor), whereas the Sega lightgun
works alright on TV's and (most) monitors. Since I never had a Best
lightgun I cannot comment on this one... (Andreas Magenheimer);

Subject: 6.9) What paddles were produced for the Atari?

This section by Andreas Magenheimer.

- Atari Paddles (usually a pair of Paddles);
- Telegames Paddles (available as a) a single paddle and b) a pair
of paddles);
- Reston Paddles (available as a) a single paddle and b) a pair
of paddles);
- and many others...

Note: Both single and duo (pair) paddles are compatible to each other,
using only one port-connector (only one joystick port). Thus, with a pair
of paddles you can connect up to 4 paddles (2 pairs) to the XL/XE models
and up to 8 paddles (4 pairs) to the Atari 400/800 models.

Subject: 6.10) What voice/sound synthesis hardware was produced for the
Atari?

This section by Andreas Magenheimer.

- Voice-Box II by The Alien Group (a software and hardware package);
- 1400XL/1450XLD Voice Synthesizer (built-in chip inside the extreme rare
Atari 1400XL/1450XLD models);
- Talk is Cheap by Ed Stewart, Antic Volume 2 Number 4, July 1983,
pages 64-66; hardware schematics only (a test/demo program is
mentioned in the text, but not printed in the magazine!);
- Cheap-Talk by Lee Brilliant, Analog Computing, issue 29, April 1985,
pages 59-67; hardware schematics and software demos, for example
"First Words");
- many other voice synthesizers (mostly selfmade and based on a chip by
National Semi Conductor);

Subject: 6.11) What sound-digitizers/samplers were produced for the Atari?

This section by Andreas Magenheimer.

- Parrot (2-Bit) by Alpha Systems, Anthony Ramos;
- Parrot-2 (2-Bit or 4-Bit?) by Alpha Systems, Anthony Ramos;
- 2-Bit Replay (2-Bit) by 2Bit-Systems Ltd.
- Sound N'Sampler (2-Bit) by Ralf David;
- Sound Digitiser (2-Bit) by Ralf David;
- Sound-Meister (2-Bit) by Irata;
- Sound-Digitizer (2-Bit) by Irata;
- Digitales Mikrofon (2-Bit) by Compyshop;
- Voice-Master (2-Bit) by Covox Inc.;
- Analog-Sample-Processor (2-Bit) by Steven Lashower (Analog Magazine);
- Atari-Sound-Sampler (2-Bit) by Andreas Binner and Harald Schoenfeld (german Atari magazin 1/1989, pages 44-49, complete with schematics, documentation, sample-program and assembler-source);
- Alphasys-Sound-Sampler cart. (4-Bit) by ANG/Mirage (released as a mono version; a stereo (two Pokeys!) version was promised/planned, but afaik never released);
- ARGS-XE-Sampler (8-Bit) by ABBUC regional group ARGS (only one or two prototypes exist, alas the hardware was never released due to lack of (sampling/digitizing) software; maybe a good idea for the hardware and software experts out there!);
- and many others ...

Subject: 6.12) What sound-enhancement upgrades were produced for the Atari?

This section by Andreas Magenheimer.

a) enhancements for stereo-sound:

- POPS, polyphonic-pokey-sound by Lee Brilliant (stereo-support with one Pokey!); refer to Analog Computing, issue 66, november 1988, pages 54-60; only 1-2 programs exist for this mod., see: 8.14 stereo-software for the Atari;

- stereo with two Ataris (and thus 2 Pokey chips); use computer/pokey 1 for the left channel and computer/pokey 2 for the right; no special hardware required for this trick (but specially programmed software!); see also: 8.14 stereo-software for the Atari;

- stereo with 2 Pokey chips (in one Atari!); refer to an article written by Chuck Steinman (which probably appeared in Atari classic?) on how to upgrade your Atari internally with a second Pokey chip; or ask Freddy Offenga for a deluxe-stereo-version, that uses a PCB instead of the piggy-back method. For a list of software that supports this mod. see also: 8.14 stereo-software for the Atari;

- Stereo-Blaster and Stereo-Phaser by Portronic/AMC-Verlag, these were hardware add-ons that connected via the monitor jack to the Atari and gave you "another" monitor jack and 2 cinch connectors to connect to

the monitor and/or the hifi-system; various small paddles (4-10, depending on the model you have) make it possible to change amplitudes, frequencies, etc. and thus generate a "pseudo-stereo" sound. These add-ons also amplified the sound and thus made quality recordings of Atari sounds much easier. Alas, these hardware add-ons were quite expensive and thus not many (less than 100) were sold. Therefore no special software is required, every A8 sound can be changed or enhanced to "simulated-stereo"...

- Stereo-Blaster-Pro, a hardware add-on by Portronic/AMC-Verlag similar to Stereo-Blaster and Stereo-Phaser, but programmable! This add-on had only 1 small paddle, to amplify the sound-volume; the stereo-sound could be generated via two simple Poke-Statements, a demo-disk therefore was included. Alas, not many items were sold and afaik no-one else programmed stereo-software for it. See also: 8.14 stereo-software for the Atari...

b) other sound enhancements:

- Covox-Sound-Enhancement, originally developed in Poland; with some electronic parts and pieces you can upgrade your Pokey's abilities, to playback any digitised/sampled sound with 8-Bit resolution, instead of its usual 4-Bit digi/sample playback resolution (see also 8.14).

- SID-upgrade, the SID is the standard sound-chip in the C64 computers. Some polish freaks/nerds have found a way to include it into an A8, but allthough I have seen quite a lot of pictures (for example at atariarea.nostalgia.pl) with this mod. and already found 1 or 2 programs that detect it (for example System Info 2.x by Draco), I have not yet found any schematics for this upgrade. Anyway, it exists, and with some programming skills it would surely be possible to write programs then, that playback SID sounds on those Ataris which have this upgrade installed...

- Amie/Amy sound-chip, the Amie sound-chip was originally produced by Atari and installed into the 65XEM computer. Alas, it was never available to the public and only very few prototypes of this 65XEM (maybe less than 10?) do exist. Besides of that RUMOURS say, that Atari had quite some problems with this soundchip and never finished it completely/successfully. If the rumours are true, then this soundchip provided many more sound channels, more octaves and even more and better sound power than two Pokeys together (for more infos take a look at this URL:)

- guess there are dozens of other sound enhancements, for example sound cards (like Adlib, etc.), sound-chips, midi-interfaces, etc. that could be attached or converted to the A8; I won't name them all here...(A.M.)

Subject: 6.13) What MIDI enhancements are there for the Atari?

This section by Andreas Magenheimer and Mathy van Nisselroy.

Midi is standard on the Atari ST computers, because it is built-in into these computers. Nevertheless, Midi was long before the arrival of the ST computers on the market and thus, it is no surprise that there are even midi-interfaces and enhancements for the classic 8Bit Ataris. The following "types" do exist:

- "Midi-Mate" and "Midi-Track" by Hybrid Arts (USA), comes with hardware + software, see reviews & tests in Antic, Analog and other magazines. MidiTrack requires 48k RAM, MidiTrack II 64k RAM and MidiTrack III 128k RAM (XE compatible, not Axlon compatible). MidiMate features MIDI IN+OUT and SYNC IN+OUT ports, but lacks a second SIO plug. MMS (MIDI Music System) is a MIDI version of AMS, also sold by Hybrid Arts and comes with AMS to MMS converter software...

- "MIDI Master" by 2-Bit Software (UK), comes with hardware+software. Features MIDI IN+OUT ports, an extra SIO plug, but no SYNC ports. See also reviews and ads in (New) Atari User...

- "MIDI interface" by DIGICOMM (UK), comes with hardware + 'example programs'. Features MIDI IN, THRU and OUT ports. There`s no word about a second SIO plug or any SYNC ports. See also reviews and ads in (New) Atari User...

- "MIDIMAX" by Wizztronics (UK), comes with hardware and software. Features MIDI IN+OUT ports and a second SIO plug. The MMS software that comes with MidiMax requires 48k RAM and is fully compatible to the Hybrid Arts hardware+software. This means, one can use the software with both Midi-interfaces or use the interfaces with the software of both vendors...

- "Atari-Midi-Interface" by Karlheinz Metscher (appeared in the german magazine Computer Kontakt June/July 1986, pages 69-75, complete with documentation, schematics and its first program "Midi-Receiver"; in Computer Kontakt October/November 1986 appeared the second program, called "Midi-Disk" - a Midi Recorder and Player program);

- "Midi-Interface for Atari XL/XE" by Ireneusz Kuczek (appeared in the german ABBUC magazine, issue 65, pages 3-6); the paper-mag. includes a schematic for the midi-interface and some translated descriptions for the software (translated from polish to german language), whereas the disk-magazine contains the midi-programs "Midiplay Version 1.3" by I. Kuczek, "Midi-Recorder Version 1.2" by I.Kuczek, "Rec to Mid" by I. Kuczek (a converter program for the IBM-PC!), "Midi-Sequencer V.1.15" by Maciej Sygit and "Midi-Pattern-Editor MPE V.2.3" by Radek Sterba. These programs and many additional demo sounds are also available in the ABBUC PD library (PD numbers 625-632).

- guess there are several other (selfmade) midi-interfaces for the Atari 8Bit available, alas they also require a keyboard or synthesizer and self-created (or downloaded) midi-sounds can only be played back via such a midi-interface and the affore mentioned keyboard/synthesizer. As of yet, it seems there exists no midi-player program, that can playback any midi-sound via the Atari Pokey chip, nor any converter

program, which can convert *.MID sounds into other Atari sound formats
(that could be played back on the Atari then)...

Subject: 6.14) What graphics enhancements are there for the Atari?

This section by Andreas Magenheimer.

- some 80 column interfaces made by Atari and third parties. Allthough
these interfaces are there to provide a better text display with 80
chars. per line, they can somehow be used as a simple graphic
enhancement; think I have seen a graphic demo for the XEP-80 device
somewhere, that used a higher graphic resolution in Gr. 0 or Gr. 8
and also provided some animation (not only text, but also graphics),
alas I don`t remember the name of that demo...;
- the ultra-rare 1090XL box and probably graphic cards for it (who-ever
owns this item, doesn't use it, who-ever would like to have + use it,
doesn't own it or cannot afford it!);
- more seriously: Antic and GTIA upgrade by Chuck Steinman. Afaik, an
article about that topic appeared in Atari Classic, since I do not own
it, I can merely speculate that it adds a second Antic and GTIA for
higher resolution and/or more colours...;
- many selfmade upgrades, using graphic chips or graphic cards from other
computers...

Subject: 6.15) What types of memory upgrades are there for the Atari?

This section by Andreas Magenheimer.

Just a short overview here, for a more detailed description (table), see
also 8.10 kinds of atari ramdisks (and 8.11 + 8.12 for programs that
support or require a ramdisk). The following memory enhancements do exist:
- Atari 400/800: ramdisks on memory boards, that fit into the normal
Atari 800 memory slots (Axlon and Mosaic types);
- Atari XL/XE: a) internal memory enhancements:
- piggy-back versions,
- professionel PCB versions,
- SIMM-module versions;
b) external memory enhancements:
- via XL-Parallel-Bus,
- via XE-Cart.port+ECI,
- Flash-ROM cart. versions,
- other Cartridge versions,
- RAM-Card versions,
- SIO-cartridge versions,
- ...
Note that many of these XL/XE memory enhancements are just hobbyist or
selfmade-projects. Most versions which use newer PC technologies
(Flash-ROM cart., RAM-Card, SIO-cart., etc.) are still under development!

Subject: 6.16) What networking hardware is there for the Atari?

This section by Andreas Magenheimer.

In the late 80`s and early 90`s an american "firm" called Dataque
developed some networking-computer-hardware to link two or more Ataris
together, so that multiplayer games are possible, where each user has
its own computer and tv/monitor screen. The hardware was/is computer
independant and will run fine on any Atari 8Bit computer (whereas most
software for it will only work on XL/XE computers). During a 3-4 year
period of development two different hardware add-ons were developed:

a) Gamelink-1: This hardware was developed in 1989/90. It links two
computers together via the joystick ports. It is limited to a maximum
of 2 computers and thus 2 or 6 players, meaning one free port per
XL/XE computer and 3 free ports per 400/800 computer. However, the
few existing games for this hardware merely support 2 players, no
matter, which computer you have...

b) Gamelink-2: This hardware was developed in 1991/92. It links 2 to 8
computers together via the SIO-port. One computer will then act as
the master and has to boot up the software (from tape, disk, harddisk,
etc.) first. Then all other "slave" computers connect to it and boot
off of this master computer (one after another of course). In Europe
we call this device "Multilink", mostly because of the games written
by Bewesoft (Jiri Bernasek) called Multi-Dash, Multi-Race, Multi-Worms.
A two-computer link-network can easily be done with one SIO cable, just
open the end of the SIO cable and exchange cables number 3 and 5. You
now have an easy two-computer (2-4 players) network-cable.

For some available software, that supports this networking-computer
hardware, see 8.16 which programs support networking computer hardware...

Subject: 6.17) Can I attach an ISA card to the Atari?

Yes, RoBu (Roland Buhler) of the Stuttgart ABBUC Regional Group has produced
project plans for an ISA-Bus Interface for Atari 800XL/130XE Computer, ARGS.
http://www.stud.uni-karlsruhe.de/~un55/Hardware/ISA-Interface/ReadME.html

Carsten Strotmann has released sourcecode showing how to access a Hercules
video card with the ISA-Bus Interface.
http://www.strotmann.de/twiki/bin/view/APG/PgmFardwDriverHerc

----

Subject: 7.1) What versions of the Atari Operating System (OS) are there?

Most of this section by permission from:
http://www.student.kun.nl/f.offenga/atari.htm or
http://members.chello.nl/taf.offenga/atari.htm

Atari 8-bit Operating Systems
~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Version 3.3, 6/27/1999.
By Freddy Offenga (taf.offenga [at] chello.nl (replace " [at] " with "@")

400/800 10kB OS roms
~~~~~~~~~~~~~~~~~~~~

Rev.	TV	Date	CRC-32	Part Nr(s)
A	NTSC	(?)	(?)	(?)
A	PAL	(?)	0x72b3fed4	CO15199, CO15299, CO12399B
B	NTSC	(?)	0x0e86d61d	CO12499B, CO14599B, 12399B
B	PAL	(?)	(?)	(?)

XL/XE 16kB OS roms
~~~~~~~~~~~~~~~~~~

Rev.	System	Date	CRC-32	Part Nr(s)
10	1200XL	10/26/1982	0xc5c11546	CO60616A, CO60617A

2	XL/XE	05/10/1983	0x1f9cd270	CO61598B
3	800XE	03/01/1985	0x29f133f7	C300717
4	XEGS	05/07/1987	0x1eaf4002	C101687

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.
james adds (3/8/01):
Did exist! My parents bought me an Atari 400 w/ 410 back in 1981 for
entertainment when I was badly injured in a motorcycle accident. A
year or so later I paid good money ($40 USD or so?) to have the OS A
upgraded to OS B.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.

400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.
'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between

these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:
http://www.savetz.com/vintagecomputers/arabic65xe/

Rev. Found in Size CRC-32 Date
~~~~ ~~~~~~~~ ~~~~~ ~~~~~~~~~~ ~~~~~~~~~~

~~~~~~~
Special thanks to Nir Dary for the rev.2 source code, rom dumps and
the 1200XL. It's in good hands.

~~~~~~
More info on what is maybe either the 1985 or 1987 XL/XE OS versions listed
above. From ST*ZMAGAZINE #36, Sept. 1, 1989 (as reprinted in PSAN Nov 89):
by Mark Elliot, Innovative Concepts
The following changes have been incorporated in the 130XE computer.

The O.S. has minor changes like:
A) The MEMORY TEST (from SELF TESTS) tests the extra 64K now! (in 4 squares)
B) Also, the MEMORY TEST checks the first 48K over TWICE as fast as before!
C) The KEYBOARD TEST has the F1-F4 keys missing on top. (function keys),
although the code that interprets them is probably there (like XEGS).
D) Also, it types out "COPYRIGHT 1985 ATARI" at the keyboard test, when all
tests are done. (compared to COPYRIGHT 1983 ATARI, before)
E) And, the O.S. chip itself, is on a 27256 EPROM, but only half of it is
used! (comprared to the original, which was on a 16K x 8 ROM, 27128 comp.
~~~~~~

Subject: 7.2) What is the ATASCII character set?

ASCII is an acronym for the American Standard Code for Information
Interchange. Pronounced ask-ee, ASCII is a code for representing English
characters as numbers, with each letter assigned a number from 0 to 127. For
~~~~~~

example, the ASCII code for uppercase M is 77. Most computers use ASCII codes to represent text, which makes it possible to transfer data from one computer to another.

The 8-bit Atari computers use a modified version of the ASCII character set called Atari ASCII, or ATASCII.

David Moeser produced this nice translation table.
Piotr Fusik corrected the description of Atari character 5.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)
==

SECTION ONE: CONTROL CHARACTERS

Subject: 7.3) What is Atari BASIC?

BASIC is an acronym for Beginner's All-purpose Symbolic Instruction Code. Developed by John Kemeney and Thomas Kurtz in the mid 1960s at Dartmouth College, BASIC is one of the earliest and simplest high-level programming languages, incorporating components of FORTRAN and ALGOL.

In 1978 Atari contracted with Shepardson Microsystems, Inc (SMI) to create a version of BASIC for their upcoming home computers. The following worked together on the project, which resulted in Atari BASIC:

Paul Laughton (author of Apple DOS) - project leader, co-primary contributor
Kathleen O'Brien - co-primary contributor
Bill Wilkinson - floating point scheme design
Paul Krasno - implemented the math library routines following guidelines supplied by Fred Ruckdeschel (author of the acclaimed text, BASIC Scientific Subroutines)
Bob Shepardson - Modified IMP-16 Assembler to accept special syntax tables Paul invented
Mike Peters - keypuncher/computer operator/junior programmer/troubleshooter

Three Revisions of Atari BASIC were produced: A, B, and C:
A - cartridge produced for use with the 400/800/1200XL
B - built-in to the 600XL/800XL, also produced on cartridge

C - built-in to the 800XL(late models)/65XE/130XE/800XE/XE Game System,
also produced on cartridge.

In order to find out what version you are running, at the READY prompt,
enter "? PEEK(43234)"

If the result is: You have Revision: Atari Part#:
162 A CO12402/CO14502
96 B CO60302A
234 C CO24947A

On versions A, B, and C, Greg Miller writes:
"Rev A had a number of bugs, not just the commonly described crash bug.
Rev B fixed most (maybe all, I don't remember) of these, but in the
process, they added a new bug. You see, the crashes were caused by a bug
in one of OSS's memory move routines. When the bug was fixed, the fix
mistakenly applied to a routine that actually worked in Rev A, causing the
new lockup problem.

Rev C differs in only a few bytes. AFAIK, the only change was to remove
the alteration made to the routine that was broken by Rev B.

Also concerning versions A, B and C, Russ Gilbert writes (3 Jul 2002):
"I've got an opinion on this, my opinion is wrong to 95% of Atari users.

B is a re-compile of A. C is a 12 byte patch to B.

I've used Atari BASIC for a millenium (?). B has less hangs and
ridiculous stuff like losing DIMs and stuff. C hangs like a lot. I must
admit I don't have very much experience with C as I go back to B after
using C for a short time.

I prefer B. I know its foibles. Just LIST, NEW, ENTER, SAVE every 5 or
6 SAVEs. Also, 0 REM will help with ENTERs that aren't working (put a
immediate 0 REM line before you ENTER.)"

Subject: 7.4) What are Atari DOS 1, DOS 2.0S, DOS 3, DOS 2.5, and DOS XE?

Here are short descriptions of the various Disk Operating Systems (DOS)
versions produced by Atari for use with their 8-bit computers.

The original Atari DOS shipped with all 810 disk drives from 1979-1981. It
consists of a single file, DOS.SYS, which is loaded into memory from disk on
startup.
At the top of the menu screen it reads:
DISK OPERATING SYSTEM 9/24/79
COPYRIGHT 1979 ATARI
Unless you are a collector, you probably have no reason to work with DOS 1.
Trivia: The "N. DEFINE DEVICE" menu option does not work.
The DOS 1 disk is labeled: Atari 810 Master Diskette (CX8101).

DOS II Version 2.0S was shipped with all 810 disk drives, and early 1050 disk drives, from 1981-1983. It consists of two files:
- DOS.SYS is loaded into memory from disk on startup
- DUP.SYS, which contains the DOS menu, is loaded only when needed.
MEM.SAV can be employed to preserve the contents of memory to disk when DUP.SYS is loaded, so that the data can be restored to memory when exiting from the DOS menu. DOS 2.0S supports Atari's proprietary single-sided, single density 90K 5.25" floppy disk format only. DOS 2.0S represents the lowest common denominator of Atari DOS versions--you can be assured than any Atari disk drive for the 8-bit Atari can work with disks formatted with DOS 2.0S. DOS 2.0S can read disks written with DOS 1; the reverse is not the case. The DOS 2.0S disk is labeled: Atari 810 Master Diskette II (CX8104).

DOS II Version 2.0D was shipped with the rare Atari 815 Dual Disk Drive. Supports double-density disk drives; also supports single-density disk drives. The DOS 2.0D disk is labeled: Atari 815 Master Diskette (CX8201).

DOS 3 shipped with 1050 disk drives from 1983-1985. It was created in part to take advantage of the 1050's Dual-Density capability, by employing a single-sided, enhanced-density 128K 5.25" floppy disk drive format. Atari called this format "dual-density," but the Atari community quickly came to refer to this format as "enhanced-density" to better differentiate it from widely available 3rd-party truly double density disk drives and supporting versions of DOS. DOS 3 uses a disk format incompatible with DOS 2.0S. It included a utility to convert files from DOS 2.0S to DOS 3, but not back again. It used disk space less efficiently than DOS 2.0S. For these reasons and others, DOS 3 was not widely accepted by the Atari community, and like DOS 1 is not generally used except for curiosity's sake. The DOS 3 disk is labeled: Master Diskette 3 (DX5052).

DOS II Version 2.5 shipped with 1050 disk drives and early XF551 disk drives from 1985-1988. DOS 2.5 represented Atari's relenting to the masses, returning to DOS 2.0S compatability. DOS 2.5 very closely resembles DOS 2.0S, with just a few features added. It supports both DOS 2.0S single-density 90K formats, as well as an enhanced density 128K format for use with the 1050 disk drive. DOS 2.5 also includes a RAMdisk utility for use with the 128K 130XE computer, a utility to convert files from DOS 3 disks back to DOS 2.5, and other disk utilities. DOS 2.5 is just about as universal among Atari users as DOS 2.0S.

DOS XE shipped with XF551 disk drives from 1988-1992. Like DOS 3, DOS XE introduced a whole new format for Atari floppy disks; but unlike DOS 3, DOS XE also preserved general compatability with DOS 2.0S/2.5. DOS XE supports the full capabilities of the double-sided, double density 360K per 5.25" floppy disk XF551 disk drive, including that drive's high-speed burst mode. DOS XE also fully supports the 90K SS/SD capability of the 810 disk drive, the 128K SS/ED capability of the 1050 disk drive, the 180K SS/DD capability of most 3rd-party disk drives for the Atari, and a RAMdisk for use with the 130XE. Date-stamping of files is supported. DOS XE requires an XL or XE computer; it is not compatable with the 400/800 computer models. Even though DOS XE was critically well-received, and represented a substantial jump in capabilities over DOS 2.5, its arrival came so late in the crouded realm of Atari and 3rd-

party DOS versions that it never achieved much acceptance among real users, and is now relegated to the same status as DOS 1 and DOS 3 before it. Before its release, DOS XE was widely known as "ADOS."

Subject: 7.5) What are MyDOS, SpartaDOS, and other popular DOS versions?

Section includes contributions by Andreas Magenheimer (most DOS 2 clone descriptions).

Atari DOS versions are very popular, but many 3rd-party DOS versions have also been developed over the years. Of these, MyDOS and SpartaDOS seem to be the most-used today.

MyDOS 4.53
==========
MyDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support, along with many other "high-end" features.

MyDOS 4.53/3 was released as freeware by David R. Eichel on 1/1/90. Defaults to a 3 character file length/free sector count instead of MyDOS's normal 4. Supports multiple AUTORUNs at boot up (*.AR0 through *.AR9). Supports Axlon RAMdisks.

MyDOS 4.53/4 is the same as 4.53/3, but uses a minimum of four characters in the sector count just like most versions of MyDOS.

MYDOS 4.51 was developed by Wordmark Systems (Charles Marslett). Source code is available as "abandonware" at: http://www.wordmark.org/

MYDOS 4.50 was released on 11/28/88, developed by C. Marslett & R. Puff
http://www.nleaudio.com/css/files/MYDOS45M.ARC

Mathy van Nisselroy's MyDOS page:
http://www-users.rwth-aachen.de/mathy.van_nisselroy/mydos.htm

SpartaDOS 3.2, 3.3, X (4.22)
============================
SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MyDOS disks.

There are many versions available. Hopefully this list will help keep them all straight.

SpartaDOS X (SDX) cartridge

Greatly enhanced/expanded compared to disk- based SpartaDOS; completely different source code. Several versions produced:
4.22 11-05-95 released by Fine Tooned Engineering (FTe)
4.21 7-10-89 released by ICD
4.20 2-06-89 released by ICD
4.19 1-16-89 released by ICD
4.18 10-29-88 released by ICD

4.17 ?-?-88 released by ICD

SpartaDOS Pro 3.3a, 3.3b, and 3.3c - 1994-

The SpartaDOS Pro 3.3 versions were developed by Stephen J. Carden, based upon a dissembled copy of the older (more stable?) 3.2c release from ICD.
-- SpartaDOS Pro Ver 3.3a 3-Nov-94 -- Added MUX support and MS-DOS Commands. Highspeed SIO routines NOT included. Recommended for use in emulators (especially Xformer) only.
-- SpartaDOS Pro Ver 3.3b 25-Dec-95 -- Has two different SIOV handlers, one for the MUX and one for the MIO.
-- SpartaDOS Pro Ver 3.3c 1995 -- Looks at your system and by checking it determines what CIO handler to load, and has MS-DOS command set. Black Box, MUX, and MIO are fully supported, though none of these are required.
-- SpartaDOS Pro Ver 3.3c 19-Dec-97 -- the same 3.3c produced on a 16K ROM cartridge by Video 61.
-- SpartaDOS Pro Ver 3.3d -- exists, but is not in general release

According to Lance Ringquist:
K-Products contracted FTe to develop SpartaDOS Pro 3.3 for exclusive use and distribution with K-Products' BBS Express! Pro, to provide this BBS system with the most stable platform possible. As Video 61 now owns the rights to BBS Express! Pro, SpartaDOS Pro 3.3 is therefore now a product of Video 61.

According to Stephen Carden:
The SpartaDOS Pro 3.3 versions were never owned by K-Products, and are technically shareware owned by FTe, although FTe had no connection with the specific development of the 3.3 versions.

SpartaDOS 3.2g and 3.2gx - Dated 6/4/94.

Last official disk-based versions, released as shareware by Fine Tooned Engineering (FTe), who had purchased the rights from ICD. 3.2g is the primary version; 3.2gx differs only in that it locates the disk buffers under the OS to save RAM. 3.2gx is intended for use in systems that include a PBI device (MIO, Black Box); it is not compatible with BASIC XE or any other programs using RAM under the OS.

First shareware release from FTe: 3.2f.

Earlier major releases from the original developer, ICD: 3.2d, 3.2c, 2.3, 1.1

Only the SDX cartridges and the original version 1.1 are compatible with the 400/800 computer models; SpartaDOS 2.x, and 3.x require an XL/XE.

Many disk-based SpartaDOS versions are available for download here, Thunderdome, kept by SysOp Fox-1:
http://www7.brinkster.com/atari/ataridl/sdsys.htm

One source of SpartaDOS documentation is Russ Gilbert's page at:
http://my.en.com/~russg/

BW-DOS 1.30 and BW-DOS Update #2 - Released: 12/95 ("BeWe")
==========
Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek. (it is pronounced "Bay Vay Dos") which is SpartaDOS compatible. Does not use any speeder internally, but comes with external XF551 speeder. Supports 4 drives and Ramdisk, comes with Ramdisk driver for XE compatible Ramdisks up to 1Megabyte; supports 4 densities: a) Single (90k), b) Enhanced/Medium (130k), c) Double (180k) and d) DSDD (360k); does not use any RAM under OS ROM; unlike SpartaDOS most commands are external, thus the DOS is only 5kbytes short; supports a PAL clock (made by ABBUC regional group "ARGS"); comes with many great utilities (which can also be used with SpartaDOS); paper printed German and disk printed English docs are avaiable; latest version 1.3 is avaiable as Freeware...

The other DOS varieties mentioned below are all, like MyDOS, Atari DOS-2 clones and thus DOS-2 compatible; avaiable as PD or Freeware...

TOP-DOS 1.5+
==========
Carolyn Hoglin writes:
This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed to do that on drive 1.) Also supported are large ramdisks for Axlon, Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an excellent manual explaining how to use its powerful capabilities.

SuperDOS 5.1
==========
supports 4 formats SD/ED/DD/DSDD; supports 256k Xtra RAM/RD; supports 4 speeders: Happy+Speedy+XF551+US Doubler and its compatibles; has an AUX.SYS file with option to use / not use RAM under OS ROM; has unfortunately a very slow Ramdisk;

BiboDOS 5.4 and 6.4
==========
3 versions avaiable, one without speeder - 5.4NT, one with Happy/Speedy support 5.4HS and one with XF support 6.4XF; supports 4 formats / up to 360k; supports 256k Xtra Ram / RD; the DUP.SYS uses RAM under OS ROM, thus Turbo-BASIC must load without DUP;

Turbo-DOS 2.1
==========
Master-Disk produces 4 different versions: 2.1NT without speeders, 2.1HS for Happy/Speedy, 2.1XF for XF551 and 2.1EX for 3 speeders: Happy+Speedy+XF551; supports 256k Xtra RAM / RD and supports use of batchfiles; has converter for DOS 3 and DOS 4; supports 4 formats, up to 360k; does not use RAM under OS ROM; DUP uses a Command Processor; all commands are avaiable via HELP key; works with XL/XE computers only, does not load/boot on Atari 400/800 no clue why;

Subject: 7.6) How do I modify Atari DOS to support more than two drives?

Russ Gilbert writes:

DOS 2 type DOSes default to two drives.
Boot DOS and BASIC.
? PEEK(1802)
if it is 3 then you only recognize two drives.
To get the 3rd drive, poke 1802,7. Then go to dup.sys (type DOS)
and write system files. Next time you boot that DOS, you'll recognize
3 drives.
If you want four drives, poke 1802,15.

Subject: 7.7) Are there Graphical User Interfaces (GUIs) for the Atari?

Contributors: Andreas Magenheimer, Mathy van Nisselroy, Kathleen Ferrante

- Diamond GOS version 1 (a cart and a PD demo-disk-version do exist), version 2 (cart only), version 3 (cart only); plus some applications (painter program, text program, etc.); Diamond GOS has been made freeware by the author Alan Reeve;

- G.O.S., the Graphic operating system by Total Control systems; two different versions are avaiable (I call them GOS 1 and GOS 2) and they are PD;

- G.O.E., the Graphic Operating Environment also by Total Control Systems (this one merely works under Sparta DOS, not with Bewe-DOS and not at all with DOS 2.x); so far I have found 3 different versions (GOE 1,2,3) with some applications (graphic/painting program, etc.); PD;

- S.A.M., the Screen Aided Management (unfortunately it has the same name as SAM, the software aided mouth) from PPP/Germany. It is avaiable in two different versions: a) the type-in listing from Atari magazin and/or the Lazy finger disks (which are PD!) or b) the commercial version 2.0 which has many add-ons and can still be bought from Dean Garaghty/UK or PD-World-Versand/Germany; This GUI merely works correct under DOS 2.5 and Medium/dual density, however...

- BOSS-XL, the XL-Desktop from Mirko Sobe; written in Turbo-BASIC; freeware; http://www.atarixle.de/

- BOSS-XE, the XE-Desktop from Mirko Sobe; written in Turbo-BASIC;freeware, http://www.atarixle.de/

- BOSS-X the newest desktop version from Mirko Sobe, needs an 128k+ Computer (128k or more memory), supports MyDOS up to 16MB and MyDOS subdirs...; still written in Turbo-BASIC; many applications and drivers; freeware; http://www.atarixle.de/

- XL-TOS a small and "cheap" GUI version from Atari magazin (i.e. a type-in listing; the BASIC file, which consists of many data lines creates a short object code file); unfortunately this GUI only looks good, it loads almost nothing... PD;

- ST-TOS a small BASIC program, that looks like a GUI; it can merely load BASIC files and do a few DOS commands, like lock, unlock, delete and such... (PD)

- BASIC desktop, a GUI written in BASIC just as a sample, what can be done with an 8-bit computer; this one loads BASIC and text files (maybe also ML files); PD;

- DCS, the desktop construction set from Tom Hunt; there are 3 different versions avaiable, a) for DOS 2.5, b) for MyDOS andc) for Sparta-DOS; I have tested the Sparta DOS version, which worked with batchfiles and could easily load some ML files, text files and BASIC files (which were already on the DCS disk); it also works with high densities and/or hard disk partitions up to 16MB and supports subdirs of course; hmm, freeware or shareware ?!?

- ATOS - GUI by Tom Hunt/Closer To Home. http://cth.dtdns.net/atos/
1) Lets you use any demo or intro as a screen saver!!
2) Works with all Atari hardware, BB, MIO and Hard drives, SpartaDOS support
3) Lets you run files like full games and demos and then
return back to the desktop. It uses Overlays.

- Atari Desktop by ABC software (Poland), includes editors, converters, file copiers, sector copy, tape+turbo tape copy, small games, CMC finder and player and much much more; works with 64k RAM and keyboard input; disk manuals only in polish language...

- Windows XL a Turbo-BASIC GUI with some nice add-ons, like calculator, editor and other things. written in 1986-1988 by Joerg Forg.

- there are a lot more GUI programs, however many of them are written in BASIC or Turbo BASIC and are very restricted; most of them merely look like a GUI but need to much memory for everyday use. Thats why most users still prefer those DOS or Gamedos (Gameloader, Multiloader, etc.) programs...

Subject: 7.8) What should I know about modem device handlers?

In order to use a modem on the Atari, a modem software handler, or R: device handler, must be loaded into memory.

There are several families of R: handlers, corresponding to the different ways in which a modem may be attached to the Atari.

Except for family #7 below, these handlers are used in one of two ways. Either they are (A) loaded into memory from DOS just before running the main terminal application, or (B) the terminal program is appended to the handler, so that in practice, a single file is loaded from DOS which contains both the R: device handler and the application itself.

1) 835/1030/XM301 modems. Atari-only modems, interface via SIO

2) MPP/Supra modems. Atari-only modems, interface via joystick port

3) R-Verter cable. Connect standard Hayes-type modems via SIO
/ SX212 modem. A Hayes-compatible modem, interface via SIO

4) SWP ATR8000 interface. Standard Hayes-type RS232 modems via this interface.

Richard Anderson writes (Oct 2 02):
Mine originally came with a driver program; and, I believe, a BASIC program
to set up the driver from BASIC. Later they shipped with a special version
of MyDOS with the R: handler built in.

5) 850 Interface/P:R: Connection, internal

This type of "mini handler" simply loads the R: device handler code from a ROM
chip inside the RS232 serial interface. A long beep is heard through the
speaker when the handler is loaded into the computer's RAM.

Many varieties of DOS for the Atari include an explicit provision for loading
this type of R: handler into memory from the 850 or compatible interface.

Also, this type of R: handler is automatically loaded when any 8-bit Atari
computer is turned on with a P:R: Connection or powered 850 connected, but no
powered disk drive is present.

6) 850 Interface/P:R: Connection, external

Used with the 850/P:R: Connection in place of these interfaces' built-in
handlers.

7) MIO/Black Box interfaces, internal

These interfaces utilitize the PBI or ECI parallel ports on the Atari. They
include their own R: handlers in ROM, using no computer RAM at all.

8) MIO/Black Box interfaces, external: Len Spencer's Hyperspeed

This handler is "optional" for the Black Box, but "essential" for the MIO
in order to take full advantage of the high-speed hardware handshaking
capabilities of these two interfaces.

Hyperspd.arc is available at http://members.aol.com/lenspencer/atari8.htm

---

Subject: 8.1) What programming languages are available for the Atari?

This section is by Freddy Offenga.

Revision : 1.9
Date.... : 2004-3-30

==========
The goal is to give information about all available languages
for the Atari 8-bit computer. This information includes:
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Maintainer: Freddy Offenga
Email : taf.offenga [at] chello.nl (replace " [at] " with "@")
URL : http://members.chello.nl/taf.offenga/atari.htm

==========

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language titel (medium)
version, year : version, year
author/company : author/company
available..... : where/how to get it
package....... : programs, documentation
features...... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Credits
=======
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup
- umich (University of Michigan Atari archive)
- David Wyn Davies (PL65)
- Kevin Savetz (APX titles)
- Maury Markowitz
- Michael Current
- JT (ValForth)
- Andreas Magenheimer
- Winston Smith
- Carsten Strotmann

Revision history
================

1.9
- X-Assembler updated
- Added "QS FORTH" info from Winston Smith
- Added FORTH section work from Michael Current (thanks to Carsten Strotmann)
(see also: http://www.strotmann.de/twiki/bin/view/APG/LangForth)
- Several updates in the assembler section

1.8
Thanks to Adreas Magenheimer for these updates:
- Added "Mesa-Forth"
- Added "130XE Assembler 4.32"
- Updated "SynAssembler"

1.7
Thanks to Maury Markowitz for these updates:
- Updated "A BASIC Compiler"
- Added "Der BASIC Compiler", "MMG BASIC Compiler"
- Added "Frost BASIC", "TT-BASIC XL"

1.6
Synchronized with Atari 8-bit FAQ May-2002 :
- Added "X-Assembler"
- Added "CTH Fast Basic"
- Added availability for "Deep Blue C"
- Added availability for "Atari Pascal"
- Ignored changes "Kyan Pascal" (need more info)
- Updated "ValForth"
- Updated "Extended fig-Forth"
- Updated "fun-Forth"
- Added "Extended WSFN"
- Removed e-mail addresses
- Added availability for "A65"
- Updated "PL65"

1.0 .. 1.5
Changes not noted.
Old versions are available on request.

a) ASSEMBLER

- 130XE Makro Assembler (disk)
version, year : 4.32, ?
author/company : Torsten Karwoth
available..... : freeware, ABBUC PD #297
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
Two pass 6502 assembler with integrated menu, editor
and monitor shell for 128KB RAM Ataris. Source format
is derived from Atmas Makroassembler.

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ABBUC PD #368
package..... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features..... : macros
New version with 128KB - 1088KB RAM support.
Two pass 6502 assembler with integrated menu, editor

and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : abandonware, http://www.wordmark.org/
package..... : assembler, manual
features..... : source include
Two pass 6502 assembler. Source format is based on the
Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?
package..... : assembler, docs
features..... : source include
Two pass 6502/65816 assembler.

- Assi (download)
version, year : 0.0.41, 2000
author/company : MacFalkner
available..... : http://members.aol.com/macfalkner/atariindex.htm
package..... : assembler, file linker
features..... : source include, data include, code relocation
Cross assembler for Win32. Source code is highly compatible with
Atmas for the Atari.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk)
version, year : 1.0C, 1981
author/company : Atari, APX
available..... : ?
package..... : assembler, editor, debugger, manual
features..... : macros, source include
Two pass 6502 assembler.

- ATasm (disk)
version, year : 0.92, 1999
author/company : Mark Schmelzenbach
available..... : umich
package..... : assembler
features..... : macros, source include, optionally target .XFD
disk images and machine state files (Atari800 / Atari800Win),

conditional assembly. Two pass 6502 portable cross assembler.
Highly compatible with MAC/65.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros
Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : 1.0, 13/12/1986
author/company : E.Reuss, Compy-shop
available..... : ?
package..... : assembler, editor, monitor
features..... : source include, data include
Two pass 6502/65c02 assembler with integrated editor/
monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package..... : assembler, editor, menu, manual
features..... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package..... : assembler, editor, monitor
features..... : ?
Two pass 6502 assembler with integrated editor/monitor.

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package..... : assembler, editor, disassembler
features..... : ?

- Kasm65 (disk)
version, year : 2.51, 1997
author/company : Ken Siders
available..... : shareware, umich
package..... : assembler, editor, linker, docs
features..... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from

the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 1.01, 1984
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : ?
features..... : ?

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.
Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAC/65 Macro Assembler (disk)
version, year : 4.20, 1994
author/company : Stephen D. Lawrow, Fine Tooned Engineering
available..... : ?
package..... : ?
features..... : ?

- MAC/65 Macro Assembler (disk)
version, year : 4.20 demo version, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : ?
features..... : ?

- MAE (disk)
version, year : .96, 1996
author/company : John Harris
available..... : umich
package..... : assembler, menu, editor, monitor, docs
features..... : macros, source include, data include,
conditional assembly
Two pass 6502/65816 assembler with integrated editor/
monitor. Extra RAM supported.

- NASM65 (disk)
version, year : ?, 1992
author/company : Nat!
available..... : ?
package..... : assembler, linker, librarian
features..... : macros, relocation, source include
One pass 6502 portable cross assembler (initially for
the ST). Highly compatible with MAC/65.

- PC-65 (disk)
version, year : 1.0 beta, 1996
author/company : Jan Feenstra & Freddy Offenga
available..... : -
package..... : assembler
features..... : macros, source include, data include,
boundary directive
Two pass 6502 cross assembler for PC/DOS. The source
format is highly compatible with the ST-65 assembler.

- Quick Assembler (disk)
version, year : 1.0, 1990?
author/company : JBW, Avalon?
available..... : ?
package..... : assembler, editor, menu, debugger
features..... : source include
Two pass 6502 cross assembler with integrated editor.
Very user friendly menu environment.

- Ra65 (disk)
version, year : 1.0, 1989
author/company : John R. Dunning
available..... : public domain, umich
package..... : assembler, linker, librarian
part of cc65 (c-compiler)
features..... : ?

- Synassembler (disk|cart)
version, year : 4.0, 1982
author/company : Steve Hales, Synapse Soft
available..... : http://www.atariland.com/members/oldatarian/
package..... : assembler, editor, monitor, manual
features..... : source include
Two pass 6502 assembler.
An Adaptation by Steve Hales of the S.C. Assembler II.

- ST-65 (disk)
version, year : ?, 1991
author/company : A. Stauffenberg, F. Offenga
available..... : -
package..... : assembler, menu shell, manual
features..... : macros, conditional assembly,
source include, data include,
boundary directive
Two pass 6502/65c02 cross assembler for the Atari ST
written in 68000 assembly. As far as I know this is
the first assembler with the boundary directive.

- Xasm
version, year : 2.5.2, 2002
author/company : Piotr Fusik
available..... : http://xasm.atari.org
package..... : assembler, docs

features..... : conditional assembly, source include,
binary include, pseudo commands,
pseudo addressing modes
Two pass 6502 cross assembler for PC/DOS. The source
format is backward compatible with Quick Assembler.

b) BASIC

- A BASIC Compiler (?)
version, year : 1.05, 1987
author/company : Monarch Data Systems
available..... : ?
package..... : BASIC compiler
features..... : ?

- Advan BASIC (disk)
version, year : ?, ?
author/company : Advan Language Designs
available..... : ?
package..... : BASIC compiler
features..... : ?

- Atari 800 Basic (disk)
version, year : 1.0, 1981
author/company : Microsoft
available..... : ?
package..... : ?
features..... : ?

- Atari BASIC (cart)
version, year : Rev.C, 1983
author/company : Atari
available..... : standard ROM in Atari XL/XE
package..... : BASIC interpreter, manual
features..... : pretty plain BASIC implementation

- Atari Microsoft BASIC II (cart)
version, year : ?, 1991
author/company : Atari
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC A+ (disk)
version, year : 3.05, 1981
author/company : OSS
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC XL (cart)
version, year : ?, ?
author/company : OSS

available..... : ?
package....... : BASIC interpreter
features...... : ?

- BASIC XE (cart)
version, year : ?, 1985
author/company : OSS
available..... : ?
package....... : BASIC interpreter
features...... : ?

- CTH Fast Basic (disk)
version/year : ?
author/company : Tom Hunt/Closer to Home
avaiable.......: PD, Freeware or Shareware;
package........: language plus several test files
and examples; english docs;
features.......: faster than Atari Basic, not much
slower than TB, does not use Ram under OS;
avaiable at Tom Hunt's homepage or elsewhere...

- Der BASIC Compiler (?)
version, year : ?, 1983
author/company : Datasoft
available..... : ?
package....... : BASIC compiler
features...... : ?

- Frost BASIC (?)
version, year : 1.04, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler
features...... : ?
Version of Turbo Basic XL that runs on 48k machines (400/800).

- MMG BASIC Compiler 2.0 (?)
version, year : 2.0, 1984
author/company : Special Software Systems
available..... : ?
package....... : BASIC compiler
features...... : ?
It appears that this is a newer version of Der BASIC Compiler,
licensed to some other company.

- TT-BASIC XL (disk)
version, year : 2.11, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package....... : BASIC interpreter, compiler
features...... : ?
Published in the German magazine "Happy Computer".

Appears to be a newer version of Turbo Basic XL.

- Turbo Basic XL (disk)
version, year : 1.5, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package..... : BASIC interpreter, compiler (V1.1)
features..... : ?
Published in the German magazine "Happy Computer".

c) C

- ACE C (disk)
version, year : ?
author/company : John Palevich & Ralph Walden
available..... : ?
package..... : ?
features..... : ?
This is a newer version of 'Deep Blue C'.

- C/65 (?)
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
Probably derived from Dr.Dobbs "Small C". Compiles to 6502
code which emulates the 8080 instruction set.

- C65 (?)
version, year : ?
author/company : Keith Ledbetter
available..... : ?
package..... : ?
features..... : good macro assembler
This compiler does not support structs.

- CC65 (disk)
version, year : 1989
author/company : John R. Dunning
available..... : umich archive,
http://www.umich.edu/~archive/atari/8bit/Languages/Cc65/
package..... : compiler, linker, assembler, librarian
features..... : ?
Public domain compiler. Also used as cross compiler.
Relocatable object linkage files, and the most thorough
K&R C for the 8-bit. Comes with an relocatable assembler.

- CC8 (disk)
version, year : 2.3
author/company : John Palevich & Steve Kennedy
available..... : ?

package..... : Compiler
features..... : ?
ACE C with more "real" C support (e.g. arrays of pointers
to structs). Requires ACE C runtime libs and linker.

- Deep Blue C (disk)
version, year : 1.2, 1982
author/company : John Palevich, APX
available..... : http://www.atariarchives.org/APX/showinfo.php?cat=20166
Source code "Deep Blue Secrets" downloadable at
http://www.atariarchives.org/APX/showinfo.php?cat=20179
package..... : Compiler, Linker
features..... : ?
Deep Blue C was originally an independent product, but it
then became available from APX. It converts C to pseudo-
code and then interprets the pseudo code (8080 instruction
set emulation).
Drawn from Ron Cain's public domain C-compiler (Small-C).

- DVC C (disk)
version, year : 1.05, 1985
author/company : Ralph E. Walden
available..... : ?
package..... : Editor, Compiler, Optimizer, Linker
features..... : Quite user friendly program
The compiler generates special object files (.CCC)
which can be optimized and linked. The package uses a
special DOS called DVC DOS which contains runtime stuff.

- LightSpeed C (disk)
version, year : 1.08, 1986
author/company : Clearstar Softechnology
available..... : ?
package..... : Compiler, Optimizer, Linker
features..... : ?
Runs under CLI DOS's and MENU DOS's.

- Tiny-C
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
First sold C compiler by OSS. This compiler was used to
compile itself! First true language "bootstrap" on any
8-bit machine (it was also available for Apple and CP/M
machines). Derived from Dr.Dobbs "Small C". Compiles to
6502 code which emulates the 8080 instruction set.

d) PASCAL

- Atari Pascal (disk)
version, year : 1.0, 1982
author/company : APX
available..... : APX-20102
Information at http://www.atariarchives.org/APX/showinfo.php?cat=20102
package..... : ?
features..... : ?
Needs two drives.

- Draper Pascal (disk)
version, year : 2.1, 1989
author/company : Norm Draper
available..... : ?
package..... : ?
features..... : ?

- Kyan Pascal (disk)
version, year : 1986
author/company : Kyan Software, APX
available..... : ?
package..... : editor, compiler, linker, macro-assembler
and manual
features..... : ?
Kyan Pascal would run off a single floppy. The Atari (APX)
version needs two drives. A version which runs entirely in
128k should be available too.

e) LISP

- INTER-LISP/65 (disk)
version, year : 2.1, 1981
author/company : Special Software Systems, DataSoft
available..... : ?
package..... : ?
features..... : ?

- INTER-LISP/65 (disk)
version, year : 2.2, 1982
author/company : Special Software Systems, DataSoft
available..... : ?
package..... : ?
features..... : ?

f) FORTH

- ES-FORTH
version, year : 1.2, 1984
author/company : The English Software Company
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthESForth
package..... : ?
features..... : ?
Seems to be based on fig-FORTH, but with some unique "Words".

Works with normal DOS.

- Extended fig-FORTH, (disk)
version, year : 11/10/1981
author/company : Patrick Mullarky, APX
available..... : APX-20029
http://www.atariarchives.org/APX/showinfo.php?cat=20029
package..... : ?
features..... : ?

- Extended fig-Forth (disk)
version, year : 1.1 Rev. 2.0, 01/15/82
author/company : Patrick Mullarky, APX
available..... : APX-20029
http://www.atariarchives.org/APX/showinfo.php?cat=20029
package..... : ?
features..... : ?

- fig-FORTH
version, year : 1/26/81 and 4/01/82 releases
author/company : Steven R. Calfee "Team FORTH"
available..... :
http://www.atariarchives.org/APX/showinfo.php?cat=unknown_fig
package..... : ?
features..... : ?

- fig-FORTH
version, year : 4/10/82
author/company : Peter Lipson / Robin Ziegler "Team FORTH"
available..... : ?
package..... : ?
features..... :
based on 4/1/82 release of fig-FORTH by Steve Calfee

- fig-FORTH
version, year : 5/5/82 - 10/16/82
author/company : Harald Striepe "Team FORTH"
available..... : ?
package..... : ?
features..... :
based on 4/10/82 release of fig-FORTH by Lipson/Ziegler

- fig-FORTH, Antic (disk)
version, year : 1.4S REV.H, 18Jun85
author/company : John Stanley/Antic Magazine "Team FORTH"
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthAntic
package..... : ?
features..... :
based on 10/16/82 release of fig-FORTH by Striepe

- fun-Forth (disk)
version, year : ?
author/company : Joel Gluck, APX
available..... : APX-20146
http://www.atariarchives.org/APX/showinfo.php?cat=20146
package..... : ?
features..... : ?

- Grafik-FORTH
version, year : 1990
author/company : RAI Production
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthGraphicForth
package..... : ?
features..... : ?
based on fig-FORTH 1.4S and TURBO-GRAPHICS-SYSTEM 256

- MesaForth
version, year : 12/03/81
author/company : ?
available..... :
http://www.strotmann.de/twiki/bin/view/APG/LangForthMesa
package..... : language, source code, documents, examples
features..... :
based on 6502 fig-Forth. The major difference is in the size of the
screen on disk (512 bytes instead of 1024 bytes).
Runs under ATARI DOS 2.0S.

- QS FORTH
version, year : 1.0, 3/27/81
author/company : James Abanese / [QS] Quality Software
available..... : http://www.strotmann.de/twiki/bin/view/APG/LangForthQS
package..... : Editor, Assembler, I/O routines
Single Density 5.25 Floppy and Manual in Binder
features..... : Editor, Assembler, I/O Routines.
based on fig-FORTH.

- Turbo-4th
version, year : January 1985
author/company : Steven R. Calfee
available..... : ?
package..... : ?
features..... :
compatible with fig-FORTH and Team FORTH. It's fast.
Not threaded, it is a true compiler

- ValForth (disk)
version, year : 1.1, 1982
author/company : Valpar International
available..... : ?
package..... : (8) disks in the set including: 1)master disk,
2)display formatter, 3)text compression and auto text formatting,
4)valDOS-I, 5)valDOS-II, 6)player-missile graphics, character editor and

sound editor, 7)general utilities and video editor, 8) Turtle &
valGraphics and advanced floating point routines.
features..... : ?
based on fig-FORTH

- X-FORTH
version, year : 26 Jan 2003
author/company : Carsten Strotmann
available..... : http://www.strotmann.de/twiki/bin/view/APG/ProjXForth
package..... : binary, source, disk image with samples & editor
features..... : aims to be compatible with new ANSI standard.
works with normal DOS.

g) PILOT

- Atari PILOT (cart)
version, year : 1980
author/company : Atari
available..... : ?
package..... : ?
features..... : ?

h) LOGO

- Atari LOGO (cart)
version, year : 1983
author/company : LCSI, Atari
available..... : ?
package..... : ?
features..... : ?

i) All the rest

- Action! (cart)
version, year : 1983
author/company : OSS
available..... : ?
package..... : compiler, editor, monitor and library
features..... : fast compiler which generates good code
Needs cartridge for runtime procedures. A PD runtime
library is also available.
All variables are static, so recursive routine calls
are not possible. No floating point type (though a
PD library should make this possible). No arrays of
objects (arrays of POINTERS to objects are possible).

- Extended WSFN, WSFN = Which Stands For Nothing
version, year : ?
author/company : Harry Stewart, APX
available..... : APX-20026
package..... : ?
features..... : ?
Info at http://www.atariarchives.org/APX/showinfo.php?cat=20026

- Quick (disk)
version, year : 2.0, 1990
author/company : Raindorf Soft
available..... : ?
package..... : ?
features..... : ?
This is the "poor man's Action!". Same restrictions as
Action! apply also to Quick. Further restrictions are:
only simple assignment expressions, no records and no
pointers.

- PL65 (disk)
version, year : 1.0, 1987
author/company : Noahsoft
available..... : commercial, Extremely rare.
package..... : compiler, editor, library, sample game
features..... : Similar features to Action with same restrictions.
Highly flexible language that includes inline assembler features and
pointers. Robust and well-engineered editor. Does not require
additional runtime library - automatically generated and included in
the compiled code during compilation.

- Test Computer Language (disk)
version, year : 2.2, 1985-1990
author/company : D.Firth
available..... : public domain, ?
package..... : compiler and editor
features..... : ?

Subject: 8.2) What cartridges were released for the Right Slot of the 800?

Contributors: Gene, Larry White, others

Austin Franklin Austin 80 Console Software
Eastern House KISS
Eastern House Monkey Wrench
Eastern House Monkey Wrench II
Geminisoft/Sar-An Magic Dump
Geminisoft Magic Dump II
Radical Systems Cartridge Maker (eprom burner)
Block (first right cart/first "backup" program hardware device)
R-Time 8 ICD (battery-backed clock, for left or right cart slots)
Real Time Cartridge Sunmark, http://www.sunmark.com/

Subject: 8.3) What games support 4 or more simultaneous players?

Contributors to this section: Jeff M Lodoen, Vidar \"Hawk\" Olavesen, Pat
Mulvey, Steven E. Posey (Party Quiz), Andreas Magenheimer, Florian Dingler,
Matthias

a) The following games support 3 simultaneous players:
(2 players via joystick, 1 player via keyboard)

- Dynakillers by GMG/Slovakia (Freeware!)
- Blastermind by Numbercruncher/Germany (Freeware!)
- M.U.L.E. cracked+changed by CSS/Germany (pirate copy!)
- some more PD and commercial games...

b) The following games support 4-joystick head-to-head play:
(Only the 400 and 800 computer models sport 4 controller ports)

- Asteroids cart. by Atari,
- Basketball cart. by Atari,
- Dandy disk by APX,
- M.U.L.E. disk by Electronic Arts,
- Maze War disk or cart. by ???,
- Silicon Warrior disk or tape by Epyx,
- Survivor disk or cart. by Synapse,
- Major League Soccer cart. by Thorn EMI,
- Major League Hockey cart. by Thorn EMI,
- Volleyball by ???
(PD game written in Atari BASIC);
- Tank Battle by Fred Pinho from Antic magazine:
http://www.atarimagazines.com/v3n2/animate.html
- Roadblock by Brian Holness from Compute! magazine
- Battle Room (CIA vs. KGB) a PD game by SNACC
- Aliens a PD-game by ??? using an altered Dandy program
(the Dandy font and thus the graphics were changed, however,
the levels remain the same and can be used in both games);
- Sky Warrior by ??? from ROM magazine, June 1984 ***
- Depth Warrior by ??? from ROM magazine, Aug. 1984 ***
- Yellow-Brick-Road by ??? from ROM magazine, Feb. 1984 ***

*** these programs are reported to be 4-player programs, I'm
not sure if they are meant to be 4-players simultaneously
or 4-players - one after another (try to find out!);

c) The following games support 8 players on the 400/800 or 4 on the other
computer models, using the 2 controllers-per-port CX30 Paddle controllers:

- Super Breakout by Atari,
- Worms? by Electronic Arts
(has nothing to do with the PC game!)

d) The following game supports 4 players on all machines, using special
4-button keypad controllers linked together with RJ-11 jacks (standard
phone jacks) to a box with 2 joystick port connectors:

- PQ: The Party Quiz Game by Suncom

e) The following programs support multi-joystick games, using extra
hardware called Quadrotron (from the german Atari magazin 2/1989):

- test program for 4 joysticks (and assembler source);
- Quadro-Tron by H.Schoenfeld (4-player Tron-clone);

f) The following programs support multi-joystick games, using extra
hardware called Multijoy (multijoy4 for up to 4 players, multijoy8
for up to 8 players and multijoy16 for up to 16 players; originally
developed by Raster/Radek Sterba, but also available from ABBUC):

- Cervi by R.Sterba (up to 8-players Snake-clone);
- Multijoy by R.Sterba (up to 4 players Tetris-clone)
- Bremspunkt by T.Butschke (up to 4 players Car-race);
- Sheeprace by F.Dingler (1 to 8 players Sheep-race);
- Cardgrabber by F.Dingler (2 to 8 players grab-a-card-game);
- Ice-Hockey by F.Dingler (4 to 8 players Icehockey-game);
- Quadrotron-M4 by R.Sterba (patched Quadro-Tron for Multijoy);
- Shoot Em' All by R.Sterba (16 players shooting-game)

The following are available at:
http://mitglied.lycos.de/gunnarbusse/bajamar/download.htm
- Asteroids, modified for Multijoy by Schmutzpuppe
- Basketball, modified for Multijoy by Schmutzpuppe
- Tennis, modified for Multijoy by Schmutzpuppe
- Dandy, modified for Multijoy by Schmutzpuppe
- M.U.L.E., modified for Multijoy by Schmutzpuppe

Subject: 8.4) What programs run only on the 400 and 800 models, and why?

The following are reported as incompatible with models other than the
original Atari 400/800. Most probably do work on XL/XE's if you use a
translator to run the original 400/800 OS on your XL/XE.

Apple Panic Broderbund
Aquatron Sierra On-Line
Astro Chase (by First Star Software) Parker Bros.
Atari Word Processor Atari
(this is not the same as AtariWriter!)
Atlantis (some versions!) Imagic
Attack at EP-CYG-4 (by Bram) Romox
Bacterion! Kyle Peacock/Tom Hudson/ANALOG#20
(http://www.cyberroach.com/analog/an20/bacterion.htm
patch for XL/XE available:
http://www.cyberroach.com/analog/an20/bacterion_patch.htm)
Bandits Sirius Software
BearJam Chalkboard
Boulders And Bombs CBS
Chicken Synapse
Dancing Feats (by Softsync) Romox
Demon Attack Imagic
Dreadnaught Factor, The Activision
Drelbs Synapse
File Manager 800+ Synapse

Forbidden Forest Cosmi
(later versions by different companies work ok on XL/XE!)
Fort Apocalypse Synapse
(cart version is 400/800 only! tape+disk versions work ok on XL/XE!)
Galahad And The Holy Grail APX
(Downloadable: http://www.atariarchives.org/APX/showinfo.php?cat=20132)
Go Hayden
Gorf Roklan
Jawbreaker II Sierra On-Line
Jet Boot Jack English Software
(can be found on various tapes/disks; at least the re-release
version by Byte Back works alright on XL/XE computers!)
Juggler IDSI
K-Razy Antiks K-Byte
K-razy Kritters CBS
K-razy Kritters K-Byte
Kangaroo Atari prototype
KoalaPainter Koala

Konrad M.Kokoszkiewicz writes:

XL/XE software won't work on 400/800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

Andreas Magenheimer adds:

To get an overview or see a chart of OS changes from the 800 to the XL
line, refer to Antic magazine Volume 3, Number 2 (June 1984), pages 10-14;
(online: http://www.atarimagazines.com/v3n2/insideatari.html)
Also note, that some software will not work correct (or not at all) on
newer XE/XEGS versions (which have a new OS with a new version number,
a new selftest/memory-test/keyboard-test, larger RAM chips, etc. etc.);

Thomas Richter contributes further details (16 Jan 2004):

There are a couple of reasons why some games don't run on the XL/XE
models. I try to order them by "likeliness", of course biased by my
personal observations:

i) The printer buffer of the XL Operating System in page 3 is a couple
of bytes shorter. The additional bytes are used for extended OS
variables not available in the 800 series. Most prominent is the $3fa
location, holding a shadow register of GTIA's TRIG3 signal. While a
true joystick trigger line in the 400/800 series, this signal is used
as "cart inserted" signal for XL/XE models. Unfortunately, the OS
compares GTIA trig3 with the shadow register at $3fa in each vertical
blank, running into an endless loop if the register contents don't
match. This causes hangs for games using page 3 either as copy-buffer
or for player-missile graphics. (Hangs by Ms. Pac-Man and
Bacterion! are caused by this, and many others...) This is "fixable"
either by the translator disk, or by a quick hack into the game,
replacing the OS vertical blank or poking TRIG3 frequently into its
shadow. The reason for the OS behaviour might be that Atari wanted to
prevent crashes if the cartridge is inserted or removed while the
machine is running. The 400/800 is powered down when a cart is
inserted, the XL/XE lacks the cover of the older models that triggered
a little switch to interrupt the power line.

ii) Similar to the above, writes to $3f8. This OS equate defines
whether on a warm start, the BASIC ROM shall be mapped back in. If
its contents are altered, a program triggering a reset as part of its
initialization will find itself then with 8K less RAM occupied by
a BASIC ROM, making it crash. Similarly, writes to the cartridge checksum
$3eb could cause a cold-start on a "reset initialization". This is
fixable by the translator disk.

iii) Some games use a four-joystick setup, or at least initialize
PIA itself. If this happens inadequately, PIA Port B, bit 0 gets changed,

disabling the ROM, and thus crashing the machine. This is not fixable
by the translator since it is a hardware issue.

iv) Direct jumps into the OS ROM, not using the documented vectors in
the $e450 area. Interestingly, this fault is not as common as it may
sound since games hardly ever use the OS. It causes failures of
some "serious applications", most notably "QS Forth" and applications
compiled by it. This is fixable by the translator disk.

As a side remark, it is interesting to note that no such documented
jump-ins exist for the math-pack ($d800 to $dfff). It is not really
part of the OS, but looks more like a part of the BASIC interpreter
that didn't make it into the OS because there was no room left. Thus,
direct jump-ins have to be used here that are documented in the De Re
Atari (for example). Atari never changed them, but it seems likely
that this documentation happened more or less as an accident since the
same source also lists some mathematics-related jump-ins into the
Basic (namely, to compute SIN and COS and related) that are only valid
for the Rev. A BASIC. Thus, the math pack might be a couple of
routines that have been originally intended for "private use" of the
BASIC ROM, but then have been found "too useful" by many others to
remain "closed". Otherwise, it is hard to explain why the otherwise
pretty cleaned-up OS comes with a construction like this.

Subject: 8.5) What programs make use of the Light Gun or a light pen?

Bertrand M. (LEXX) writes:

- Bug Hunt cart. by Atari;
- Barnyard Blaster cart. by Atari;
- Crossbow cart. by Atari;
- Crimebuster cart. by Atari;
- Operation Blood disk by ANG/Mirage;
- Operation Blood II - Special Forces disk by ANG/Mirage;
- Light Gun Blaster (PD from Page 6);
- enhanced Lightgun Blaster (PD from Pedrokko);
- Gangsterville disk by Linda Soft
(an italian game written in BASIC);
- maybe a couple more...

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4."
This renders much light gun and light pen software unusable on the 400.

Andreas Magenheimer adds:
All Lightgun games can be used with a lightpen (which is not as accurate
as a Lightgun however). And all lightpen programs can be used with a
lightgun. thus add:

- Atari Graphics cart. by Atari
(a painting/drawing program);

- Matrix a PD game by Dave Oblad
(a 4-wins or 5-wins clone!)
- Alien Invaders disk by R.Gore (available from DGS);
- Bembelwo a PD game by Thorsten Butschke
(a sort of golf/minesweeper game, written in Quick);
- Sharp Shooter by Mat*Rat a PD game from Analog,
(also available on cart from Video 61/Lance Ringquist);
- Lightgun Shooter by ??? from ABBUC mag.
(a simple shooter game, at least PD!)
- Flyshot or Flyshoot a PD game by Kemal Ezcan
(a Turbo BASIC game from ZONG, the KE Soft magazine);
- Geisterschloss game+editor disk by KE Soft;
- Lightpen Doodle by ??? from Antic magazine;
- some more PD programs and utilities for Lightpen or Lightgun;

Subject: 8.6) What programs have a track ball mode or support a mouse?

Contributors: Andreas Magenheimer, Mirko Sobe

Title Keystroke Required
------------- ---------------------
- Missile Command by Atari CTRL-T
- Slime by Synapse [T]
- Shanghai by Activision choose controller type: ST mouse !
(plug it into port 2; if you do not
have one, you have to reboot!!)
- Bombdown by Roemer of Uno choose between Joystick, Amiga
mouse, ST mouse or CX85 numeric
keypad (use port 2 for any mice)
- Minesweeper by Raindorf-Soft use an ST mouse in port 2
- The Brundles by KE-Soft use an ST mouse in port 2
- The Brundles Editor by KE-Soft, PD use an ST mouse in port 2
- Geisterschloss by KE-Soft, PD choose Lightgun (port 1) or ST
mouse (port 2)
- Vanish (ZONG, Vol. 5+6/1993); use an ST-mouse in port 2
- Hong Kong (ZONG, Vol. 5+6/1993); use an ST-mouse in port 2
- Maus-DOS (ZONG 5+6/1993); use an ST-mouse in port 2
- Faecher-Patience (ZONG 1/1993); use an ST-mouse in port 2
- Macao (Zong 5+6/1994); use an ST-mouse in port 2
- Multi-Mouse manager (PD) drivers for mice, TB, etc.
- Multiplayer 2.1 by Madteam supports ST + Amiga mouse in port A
- Unriagh I (german PD adventure) has drivers for ST mouse+Joystick
(stick=port 1, mouse=port2)
- Unriagh II (german PD adventure) has drivers for ST mouse+joystick
(stick=port 1, mouse=port 2)
- little Calculator (AMC-Verlag, PD) uses ST-mouse only (port 2)
- big UPN calculator (PD) uses ST mouse, TB, Touch tab. and
joystick; (there are different COM
files, rename the one you wish to

use to *.EXE; all drivers use port
1 - if I remember correctly)
- Operation Blood (ANG/Mirage) press mouse fire or Select to start
in ST mouse mode (port 2)
- Operation Blood 2 / Special Forces press mouse fire or Select to start
(ANG/Mirage) in ST mouse mode
- Sprint XL (ABBUC Jahresgabe 1992) uses an ST mouse in port 2
- M.O.S. (ABBUC magazine) uses an ST mouse in port 2
- Diamond GOS (Reeve software) all three versions support an ST
mouse in port 2
- S.A.M. (Power per Post) german GUI, supports an ST mouse in
port 2
- G.O.E. (TCS) supports an ST mouse in port 1
- BOSS-X (MS-Software, Mirko Sobe) supports ST-Mouse in Port 2

RE: Missile Command, Andreas writes:
there are many different versions available... I know the old Atari 800
cart version, which works correct with Joystick and Trakball, but not at
all with a mouse. The newer XL version works with Mouse, trackball and
Joystick, also the newest (built-in) XEGS version of MC. But, there is
also a tape version (and maybe a disk version) of MC available. I am not
sure if this tape version behaves like the old 800 version or like the
newer XL and XE/XEGS versions...

And about mice, Andreas adds:
Maybe you did not know, there is a little difference between Trackball
and ST-mouse. Although MC works with both input devices does not mean,
they are the same. they are not !! Connect the TB to an ST computer and
you see: it does not work at all !! You have to do a small conversion to
convert the TB to an ST mouse. (Plans are avaiable from ABBUC, Germany).

Subject: 8.7) What programs have a paddle(s) or Koala Pad mode?

Andreas Magenheimer contributes:

- Super Breakout (Atari) breakout clone
- Live Wire (Analog) tempest clone
- Live wire 2 (Analog) tempest clone
- Planetary Defense (Analog)
- Pong (Antic) Pong clone
- Pong (Analog) Pong clone
- Super Ball (Compy Shop Magazin) Breakout clone
- Arkanoid (Taito/Imagic) Breakout clone
- Koala/Micro-Illustrator (Island graphics/Koala Ware) graphics program
- Chiseler (Antic or Analog) a breakout clone
- Slime (Synapse) a slimy shooter...
- Chicken (Synapse) catch the chicken eggs...
- One on One (Compute!) a breakout/warlords clone
- Paratroop Attack by David Plotkin
- all Pinballs created with the P.C.S.

(use left paddle trigger for left flipper and right paddle trigger for
right flipper; or simply use a joystick and left/right/fire button);
- many more Pong and Breakout clones
(forgot their names, maybe someone can help here!)
- many more programs (which I do not remember right now!)

for Koala Pad only: - Micro-Illustrator / Koala Painter
- other Koala Pad painters or programs

Subject: 8.8) What programs have a CX85 Numerical Keypad mode?

Andreas Magenheimer contributes:

- Bombdown (Roemer of Uno);
- The Bookkeeper (Atari);
- Multi mouse Management (PD);
- UPN calculator (PD);
- Ball Harbour (Zong 8/1992);
- The Big Quest (Zong 7/1992);
- Blob (Zong 2/1992);
- Bomber Jack (KE-Soft);
- Catch (Zong 6/1992);
- Code table (Zong 11+12/1993);
- CX-85-Driver (Zong 7+8/1994);
- CX-85-Keycode-driver (Zong 7+8/1995);
- Donald (by KE-Soft);
- Drag (by KE-Soft);
- Dragon Fire (Zong 1/1993);
- Gravitar (Zong 4/1992);
- Hungry Goblin (Zong 5/1992);
- Invaders (Zong 5+6/1993);
- Joshi (Zong 3+4/1993);
- Lasermaze (by KE-Soft);
- Lost in the Antarctic (Zong 2/1992);
- Mampfman (Zong 8/1992);
- Minipac (Zong 3/1992);
- Minipac 2 (Zong 6/1992);
- Money Raider (Zong 2/1992);
- Monster Tracking (Zong 9/1992);
- Oblitroid (by KE-Soft)
- Pac-Man (Zong 11/1992);
- Schlumpf/Smurf (Zong 5/1992);
- Slurp (Zong 3/1992);
- Techno Ninja (by KE-Soft)
- Transsylvania (Zong 3+4/1993);
- Viro-Mania (Zong 2/1993);
- Zador XL (by KE-Soft)
- Zador II (by KE-Soft)
- many more games from KE-Soft and Powersoft;
(forgot their names, help needed!)

Subject 8.9) What programs have a Touch tablet mode?

Andreas Magenheimer writes:

- Atari Artist (Atari) graphics program
- Pixel Artist Deluxe 1.3 (PD) graphics program
- The Brundles (KE-Soft) Lemmings clone
- Musorqua (Analog computing) educational program
- many more (which I do not remember right now!)

Subject: 8.10) What kinds of RAMdisks can be set up on the Atari?

This section by Andreas Magenheimer.

8.10 Atari Ramdisks - An (incomplete) Overview:
[This is version 2.10 from October 2003]

Right from the start of the Atari 8-bit computer era in the late 70`s, Atari users wanted to have as much RAM as possible (or as their purse could afford). Having a 16k machine with a tape device was nice and cheap, but having full 48k or 64k and a floppy drive was much nicer (and very expensive). Thus many Atari users began to create selfmade RAM extensions and enhancements, just to save some money. Also a lot of firms provided extra RAM, RAM enhancements, RAM extensions and Ramdisks. Besides Atari there were (and still are) quite a lot of producers, manufacturers, distributors and authors of such RAM enhancements...

This "short" and incomplete overview does not provide any docs or manuals, but gives some info about the various Ramdisks on the market. Since these notes are written by me, they will merely contain the information I have. And as you all can see - it is still incomplete. So any help and extra info, as well as corrections, are very welcome. It would be nice to see this text & info growing. For now let us start here, the info-section is divided into 8 groups:

1) Name (Name of the RD, e.g. Megaram 2 or Rambo XL or MIO, etc.);
2) Vendor/Author (or distributor, manufacturer, producer, etc.);
3) Size (size of the Ramdisk only; NOT the full computer memory);
4) [Bankswitching] Area (for XL/XE computers usually 4000-7FFF);
5) Banks (hexadecimal input count, as in MyDOS or RAMDTEST.BIN);
6) Control Bits (which bits are used to control the Rambanks);
7) Port (control Port - usually Port B for XL/XE machines);
8) Notes (any extra info, comments, miscelleanous things, etc.);

If you wish to add any other type of info, let me know. The above information should be enough for most programmers to support a RD in their programs (especially to support more than just one type of RD). Hopefully future programs will take care about this info or just use a small setup program to setup any kind of RD. Now let me begin:

A) Atari 400/800 Ramdisks:

Name Vendor Size Area
Banks Bits Port Notes

- Axlon Axlon/Atari 64k 4000-7FFF
0 thru 3 0,1 (CFFF) plug-in-board
Note: total memory = 96kbytes (32k RAM + 64k RD);

- Axlon Axlon/Atari 128k 4000-7FFF
0 thru 7 0,1,2 (CFFF) plug-in-board
Note: total memory = 160kbytes (32k RAM + 128k RD);

- 288k800 D.Byrd and others 256k 4000-7FFF
0 thru 15 0,1,2,3 (CFFF) selfmade-board
Note: total memory = 288kbytes, Axlon compatible;

- 544k800 various authors 512k 4000-7FFF
0 thru 31 0,1,2,3,4 (CFFF) selfmade-board
Note: total memory = 544kbytes, Axlon compatible;

- 1056k800 various authors 1024k 4000-7FFF
0 thru 63 0,1,2,3,4,5 (CFFF) selfmade-board
Note: total memory = 1056kbytes, Axlon compatible;

- 2080k800 various authors 2048k 4000-7FFF
0 thru 127 0,1,2,3,4,5,6 (CFFF) selfmade-board
Note: total memory = 2080kbytes, Axlon compatible;

- 4128k800 various authors 4096k 4000-7FFF
0 thru 255 0,1,2,3,4,5,6,7 (CFFF) selfmade-board
Note: total memory = 4128kbytes, Axlon compatible;

=> Note that all so-called Axlon "compatible" (256k-4096k) Ramdisks
normally do not homebank when RESET is pressed (a fix should be
available somewhere), whereas original Axlon Ramdisks do homebank
properly !! (Special thanks to Lee Barnes for this note !!)

- Mosaic RAMpower by Mosaic Electronics is actually a Ramboard, that
enhances the memory of your Atari 800; avaiable in 3 sizes: 16k,
32k and 64k (where max. 52k can be utilized from 64k). Looks like
these are no Ramdisks, just (normal/main) RAM enhancements. But maybe
the 64k Ramboard can be patched in some way to gain a small 16k or
32k Ramdisk (48k RAM + 16k RD or 32k RAM + 32k RD) ?!?

- ...

B) Atari XL/XE Ramdisks:

Name Vendor Size
Area Bits Port
Banks
Notes

=> Note that bit 4 is always used in all Port B type memory upgrades to
turn on the CPU's access to the extended memory. Thus, it is not reported
in bit use tables as a used bit as it does not control which bank gets
switched into the 4000-7FFF region. This seems to be a standard convention
as the majority of ramdisk users don't want bit 4 counted as a control bit.
And it's not a control bit - its the 'on' bit. Likewise, bit 5 is the 'on'
bit for ANTIC's access to the extended memory for 'compatible' (to 130XE)
machines as well. If bit 5 does show up in a bit use table, one can only
assume that this is an incompatible machine which doesn't have or use ANTIC
access at all. In that special case, bit 5 is then available for use in
switching in the various banks and thus gets counted as a control bit in
bit use tables. (Special thanks to Lee Barnes for this note !!)

- 130XE-Ramdisk Atari 64k
4000-7FFF 2,3 B ($D301)
Banks: E3,E7,EB,EF;
Notes: old=8kbyte chips (west), new=32kbyte chips (east);
XE`s made in China have faulty GTIAs => replace them!;
XE`s and XEGS made in China also have a new OS which causes
some incompatibility problems (try: Encounter / disk version
by Novagen or try: Muad`Dib-Demo by Hurek, etc.); just replace
the new OS with an older XL/XE one if you want less trouble!;
standard Atari RD - available with all XE-compatible ramdisks;
Antic access: YES! Atari Basic: YES! XL/XE Selftest: YES!;

- 192k-600XL Compyshop 128k
4000-7FFF 2,3,? B ($D301)
Banks: e3,e7,eb,ef,a3,a7,ab,af;
Notes: early CS upgrade version for 600XL only!;
afaik this was a piggy-back version...;
Antic access: no! Atari Basic: YES! XL/XE Selftest: YES!;

- 320k-800XL Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2b,2f,63,67,6b,6f,a3,a7,ab,af,e3,e7,eb,ef;
Notes: afaik this was a piggy-back version...;
Antic access: no! Atari Basic: YES! XL/XE Selftest: YES!;

- 320k-130XE Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2b,2f,63,67,6b,6f,a3,a7,ab,af,e3,e7,eb,ef;
Notes: afaik this was a piggy-back version with sep. Antic!;
(XE meant 130XE only! this excluded 65XE and 800XE!);
Antic access: YES! Atari Basic: YES! XL/XE Selftest: YES!;

- 512k XL various authors 448k
4000-7FFF 2,3,4,5,6,7 B ($D301)
Banks: ef,eb,e7,e3,cf,cb,c7,c3,af,ab,a7,a3,8f,8b,87,83
6f,6b,67,63,4f,4b,47,43,2f,2b,27,23;
Notes: This 512k upgrade is not the same as the one thats on the
British Underground. That one dont work, I had to fix it years ago.
The new version will replace the 64k main RAM with 512k RAM, thus
you gain 64k RAM and 448k Ramdisk. (A.M.: Afaik, it has the same

problems as the 256k RAM enhancements [with 64k RAM and 192k Ramdisk],
meaning *some* programs will try to use the main RAM as rambanks...)
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!;

- A.M. Ramdisk Atari Magazin 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: manual and schematics, as well as a parts list can be found
in german Atari Magazin 2/1987 (includes a Basic test program!);
bugfixes and updates in Atari Magazin 3/1987, 4/1988 and 5/1988;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!;

- Bob Woolley`s Atari 1200XL 1MB upgrade 960k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: EF, ED, EB, E9, E7, E5, E3, E1
CF, CD, CB, C9, C7, C5, C3, C1
AF, AD, AB, A9, A7, A5, A3, A1
8F, 8D, 8B, 89, 87, 85, 83, 81
4F, 4D, 4B, 49, 47, 45, 43, 41
2F, 2D, 2B, 29, 27, 25, 23, 21
0F, 0D, 0B, 09, 07, 05, 03, 01
Notes: this upgrade uses 64k as main RAM and 960k as Ramdisk;
Selftest: Yes!, Basic: "no" (not built-in), Antic access: no! ;

- Mathy`s RD M.v.Nisselroy 1024k
4000-7FFF 0,1,2,3,6,7 B ($D301)
Banks: EF EE ED EC EB EA E9 E8 E7 E6 E5 E4 E3 E2 E1 E0
AF AE AD AC AB AA A9 A8 A7 A6 A5 A4 A3 A2 A1 A0
6F 6E 6D 6C 6B 6A 69 68 67 66 65 64 63 62 61 60
2F 2E 2D 2C 2B 2A 29 28 27 26 25 24 23 22 21 20
Notes: uses a PC-SIMM (30-Pin-SIMM), pin-switching in RD: 4,5;
XL/XE/XEGS: Selftest+Basic=YES, XEGS: Missile Command=YES!;
no use of any switches!; Antic access: YES!; (CS-compatible!);

- Megaram 1 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: used 16kbyte Chips x16 (very big/huge pcb);
originally designed (and maybe produced?) by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 2 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 128kbyte Chips x2 (much smaller pcb);
originally designed (and maybe produced?) by Ralf David;
newer MegaRAM version; fully compatible to Megaram 1;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 1,2 => 512k B.Pahl 512k
4000-7FFF 2,3,5,6,7 B ($D301)
Banks: 03,07,0B,0F,23,27,2B,2F,43,47,4B,4F,63,67,6B,6F,

83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: upgrade for Megaram 1 or 2 to 512kbytes (which means
a total of 576kbytes memory); requires a small pcb (in
connection with the existing Megaram 1 or 2 pcb) and the
following chips: 2x 414256 (RAM), 1x 74LS138 plus some more
wires inside the computer; additionally one may install a
switch to switch down to 320k or even 64k (no RD!) if needed;
advantage: more RAM, Basic still there, 26AE & 8ACE banks...;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 Klaus Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 256kx4 Chips (514256-70); fully compatible to
K.P./R.D. Megaram 1+2; originally designed by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 Klaus Peters 1024k
4000-7FFF 2,3,6,7 B ($D301)
0,1 (or switches) B ($D600)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
$D600: F3,F7,FB,FF...
Notes: uses 1Mx4 Chips (514400-70); can be a) 1 Ramdisk of 1 Mb
or b) 2 Ramdisks of 512kb each or c) 4 Ramdisks of 256kb each;
uses four switches; the 1MB mode seems to be very incompatible!!;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

=> Note that all XL-type Megaram-Ramdisks (Megaram 1, 2, 3)
have Refresh bugs/problems which can be solved quite easily
with one 74LS08 chip (see ABBUC magazine 63, pages 19+20);
None of the Megaram Ramdisks do have the separate Antic access
built-in, but XE-types can be upgraded easily for this mode!!;

- Newell Newell Ind. 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: a) older version: 83,87,8B,8F,C3,C7,CB,CF,E3,E7,EB,EF;
b) newer version: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses
64k as main RAM and 192k as Ramdisk/extra RAM (therefore some
RD-testers will see 240k memory or 15 RD-banks which is untrue!);
the older 256k Newell version was not compatible to Rambo XL,
Buchholz and Peterson, since these were not available then;
Newell was earlier on the market than Rambo and Peterson,
while early Buchholz Ramdisks used 32k banks instead of 16k
banks; all this changed with the appearance of the 130XE
and thus Buchholz designed 16k Rambanks and finally Newell
256k Ramdisks became Buchholz/RamboXL/Peterson compatible !!
Atari Basic: YES! XL/XE Selftest: YES! Antic access: YES!

- Newell Newell Ind. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F

41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: uses 8 pc. 1Mx1 Chips (511000-80); Basic: To be able to
select the internal Basic, connect a toggle switch between ground
and the motherboard where PB1 was removed (PIA `Hole' 11). The
switch is not much different than the Option Key, and I found it
more versatile. (Wes Newell) => see also ABBUC mag. 29, page 6+7;
Atari Basic: yes/no! XL/XE Selftest: YES! Antic access: YES!

=> Note that so-called "Newell-compatible" Ramdisks (clones or
selfmade ones...) most likely do NOT have Antic access, due to
the lazyness of its creators or their intentions of simply not
needing it. However, original Newell Ramdisks created and sold
by Wes Newell do have the separate Antic access !!

- Newell Newell Ind. 4096k
4000-7FFF 0,1,2,3,4,5,6,7 B ($D301)

F0,F1,F2,F3,F4,F5,F6,F7,F8,F9,FA,FB,FC,FD,FE,FF
Notes: uses 8 pc. 4Mx1 Chips (541000-80); made by Newell, later by
FTE; seems to be very incompatible to existing software and
bankswitching cartridges (OSS, Atari, etc.), because normal RAM at
4000-7FFF is NOT available - only extra Ram/Ramdisk banks. With one
PIA chip there is simply no bit left to switch between main RAM and
extra RAM / Ramdisk. But with the installation of a second PIA chip
one would be able to do so. Furthermore one may use (almost) any
setup or banks he likes then (with a second PIA chip one could
control up to 256 Megabytes of RAM). Basic: To be able to select the
internal Basic, connect a toggle switch between ground and the
motherboard where PB1 was removed (PIA `Hole' 11). The switch is not
much different than the Option Key, and I found it more versatile.
(Wes Newell); OS: It is possible to maintain OS bankink using 4 Megs.
It requires moving the OS into RAM before any banking of that Bit
occurs. Use MOVEOS File on the [Newell-Software-] Disk. (Wes Newell)
Atari Basic: no! XL/XE Selftest: no (?) Antic access: no!

- Peterson 256k S.Peterson 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz, Rambo XL and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses 64k as main RAM
and 192k as Ramdisk (most RD-testers will therefore see 240k memory);
Antic access: no!, Atari Basic: YES!, XL/XE Selftest: YES!

- Peterson 320k S.Peterson 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to TOMS (?), incompatible to Compyshop!;
there are still the 64k main RAM plus this 256k extra RAM;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Peterson 576k S.Peterson 512k
4000-7FFF 1,2,3,5,6 B ($D301)
Banks: 81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF,
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF;
Notes: should be fully compatible to TOMS-Ramdisk (?);
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

- Peterson 1088k S.Peterson 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: fully compatible to Newell and TOMS (?) Ramdisks;
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

=> Note that (separate) Antic access can be done to all Peterson
and compatible XE-type Ramdisks; just refer to Ed Bachman`s fine
article (supplied with the manual for the Wedge) on how to
update/upgrade your Peterson or compatible Ramdisk for Antic access;
(Afaik only XE-type computers can be upgraded for separate Antic
access, since XL-type computers don`t have the Freddie and Gate
Array chips; the Freddie chip controls the Gate-Array chip; the
Gate-Array chip is responsible for the separate Antic mode...)

- Quarter-Mega-XL C.Buchholz 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF (=newer version);
Notes: compatible to Peterson, Rambo XL and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and thus uses 64k as main RAM
and 192k as Ramdisk (therefore most RD-testers will see 240k memory);
older versions were designed for 32k banks, but with the appearance of
the 130XE as the new standard, the design had been changed to 16k banks;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Rambo XL ICD 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;

Notes: compatible to Buchholz, Peterson and newer Newell versions;
replaces the 8 RAM 4164 with 8 RAM 41256 and uses 64k as main RAM and
192k as Ramdisk (therefore most RD-testprograms will see 240k memory);
built in Atari Basic: YES!, XL/XE Selftest: YES! Antic access: no!

- Rambo=>512k Dan Schmid 512k
4000-7FFF 2,3,5,6,7 B ($D301)
Banks: 00,04,08,0C,20,24,28,2C,40,44,48,4C,60,64,68,6C, (Basic
80,84,88,8C,A0,A4,A8,AC,C0,C4,C8,CC,E0,E4,E8,EC; on??)
Notes: this "project" should upgrade a Rambo XL to 576kbytes;
the docs were found on Pooldisk Too (SUBDIR: ACE/Acec202 a+b);
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no (?)

- Satantronic`s 1MB PC-SIMM Ramdisk 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: Extended RAM is not available from BASIC. But with a small
patch it is possible to access 512 KB from Basic. This is compatible
with 256 KB and 1024 KB SIMM modules. There also exists some light
modified version of this RD with some switches for better
compatibility with some "old" software. (XI of Satantronic);
Atari Basic: no! XL/XE Selftest: YES! Antic access: no!

- TOMS-RD T.O. + M.S. 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: made+standard in Poland; supported in most polish demos;
should be fully compatible to A.M. and Scott Peterson Ramdisks (?);
Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: no (?);

- TOMS-RD T.O. + M.S. 512k
4000-7FFF 1,2,3,5,6 B ($D301)
Banks: 81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF,
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF;
Notes: should be fully compatible to S.Peterson Ramdisk (?)
Atari Basic: no! XL/XE Selftest: YES! Antic access: no! (?)

- TOMS-RD T.O. + M.S. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)

C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: should be compatible to Newell & S.Peterson (?)
Atari Basic: no! XL/XE Selftest: YES! Antic access: no (?)

C) Parallel-Bus-Devices:
(600XL/800XL = parallel bus, XE = cart-port + ECI and/or adapter)

- Turbo Freezer XL Bernhard Engl 256k
4000-7FFF 2,3,4,5,6 B ($D301)
Banks: E3,E7,EB,EF,93,97,9B,9F,A3,A7,AB,AF,B3,B7,BB,BF;
Notes: The Turbo Freezer XL is an external device for the XL-PBI
with its own Operating-Sytem. It has a built-in Freezer, Monitor
and DOS. The Antic access for the RD can simply be built with one
wire from CPU to PBI. The RD Access works with Port-Bits 2,3 for
Bank Switching, Bits 4,5 for Groups and Bit 6 for "Mode-Select".
PortB D7 = Selftest (0=on)
D6 = Mode (1 = XE, 0 = Groups)
D5 = XE: ANTIC-Access (0 = on), Groups: Group H
D4 = XE: CPU-Access (0 = on), Groups: Group L
D3 = Bank Number H
D2 = Bank Number L
D1 = BASIC ROM (0 = on)
D0 = OS ROM (0 = off)
Atari Basic: YES! XL/XE Selftest: YES! Antic access: optional;

- missing info for the following Ramdisks:
other Bob Woolley Ramdisks, more 600XL Ramdisks, Rambo XL (512k by
ICD), some Irata Ramdisks, MIO, as well as many other types;
- (?) means: info is missing or I am not absolutely sure about this
information; so this has to be verified by other Atarians;

For this 20th edition special thanks and credits go to: Lee Barnes,
Russ Gilbert, Mathy van Nisselroy, Erhard Puetz, Mathias Reichl,
Ron Hamilton, Wes Newell, Guy Ferrante, XI of Satantronic, Bernhard
Pahl and Walter Lojek for sharing their info with me. Also thanks to
John Picken for writing an excellent article about ramdisks and
cartridges (especially about bank-switching, which both devices can
do). And thanks to Jindrich Kubec (Jindroush) for presenting this fine
article on his homepage... Finally thanks to Michael Current for
publishing/including this "spam" in his A8FAQ and all the nice Atarians
at comp.sys.atari.8bit for their help and patience. -Thank you Folks !!-
Well, thats it for today - there is still a lot of information missing,
I know, but any help is appreciated. If you have some more information
or other things that might help, let me know. Please do also send
corrections since there will always be some updates and corrections
nescessary. Atarian Greetings - Andreas Magenheimer.

Subject: 8.11) What programs support a RAMdisk?

This section by Andreas Magenheimer.

8.11 Ramdisk-supporting Software:
(This is Version 2.10 from October 2003)

Well, I will only list those programs here that have BUILT-IN! ramdisk
support. Why? Simply, because most if not all PD programs can support
a RD, as soon as the user a) has a certain DOS or RD driver or b) has
a special OS inside the computer or c) has any kind of special and
non-standard hardware. Just one example: With the use of QMEG+ OS it
is possible to freeze ZORK (or any other protected / unprotected program)
into the RD, then re-direct the RD as being drive 1 and finally boot
Zork off of the Ramdisk, allthough Zork does not support a RD in any way.
The same funny things can be done to other copy protected programs and
especially to unprotected public domain programs... Now, let me begin:

A) DOS programs:

a) Name(s) b) Author(s)
c) RD-type(s) d) max. size

- Atari DOS 2.0 (Atari Corp.) OSS/Atari;
a) Axlon-RDs (selfmade drivers!) 128k;
b) XE-RDs (selfmade drivers!) 130XE (=64k);
(there are some more selfmade RD-drivers available!)

- Atari DOS 2.5 (Atari Corp.) OSS/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;
b) XE-RDs (selfmade drivers!) max. 2x128 kbytes;
c) Axlon-RDs (selfmade drivers!) 128 kbytes;
(there are very many selfmade RD-drivers available!)

- DOS 3.0 (Atari Corp.) ???/Atari;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen any (nor used DOS 3);

- DOS 4.0 (Atari/Antic) Michael Barall;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen them (nor used DOS 4);

- Bewe-DOS Bewesoft/J.Bernasek;
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Rambox (standard driver!) up to 256 kbytes;
(Bewe-DOS is compatible to Sparta-DOS but does not use the RAM
under the OS ROM! many tools can be used under both DOS versions);

- Bibo DOS Compyshop/E.Reuss;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade drivers!) up to 256 kbytes;

- DOS II+D Version 6.x Stefan Dorndorf;
a) XE-RDs (standard driver!) max. 2x128 kbytes;
b) Rambox (selfmade drivers!) up to 256 kbytes;

- DOS-XE (Atari Corp.) ???/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;
b) other RDs (really?!?) unknown;
=> has the same author as the unpopular (Atari) DOS 3.0 !!;

(in the Atari scene it is as unpopular as DOS 3 and DOS 4!);

- DOS-XF (Atari Germany) Reitershan Comp.
=> similar in function to Turbo-DOS 2.1XF (but with a nice
DOS 2.0 / 2.5 DUP-menu!) => see Turbo-DOS !!

- My-DOS 4.5x Wordmark/R.Puff+C.Marslett
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Axlon-RDs (standard driver!) up to ??? kbytes;
c) other RDs (MIO, BB, etc.) up to 1024 kbytes?;

- Smart-DOS Version 6.1 Ron Bieber;
a) XE-RDs (selfmade drivers!) up to 64 kbytes;
b) Axlon-RDs (selfmade-driver!) up to 128 kbytes;

- Sparta-DOS 1.x (400/800) ICD;
a) Axlon-RDs (??? drivers) up to 128 kbytes;
b) other RDs (??? drivers) up to ??? kbytes;

- Sparta DOS 2.x, 3.x (XL/XE) ICD / FTE;
a) XE-RDs (standard drivers!) up to 1024 kbytes?;
b) others (MIO, BB, etc.) up to 1024 kbytes?;
(maybe also RD-drivers for up to 16 Megabytes ?!?)

- Sparta DOS 3.3x (XL/XE) Stephen J. Carden;
=> see Sparta DOS 2.x and 3.x !!
(especially made for use with BBS-Express-Pro!)

- Sparta DOS X / 4.x (XL/XE cart.) John Harris/FTE;
=> see Sparta DOS 2.x and 3.x !!
(maybe with RD-driver for up to 16 Megabytes ?!?)

- Super DOS 2.x Paul Nichols;
a) XE-RDs (standard driver!) up to 128 kbytes;
b) Axlon-RDs (standard driver!) up to 128 kbytes;

- Super DOS 5.x Paul Nichols;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) Axlon-RDs (standard driver!) up to 128 kbytes;

- Top-DOS 1.x R.K. Bennett
a) Axlon-RDs (standard driver!) up to 128 kbytes;
b) 130XE-RD (standard driver!) 64 kbytes;
c) other RDs (Mosaic?! driver!) up to ??? kbytes;

- Turbo-DOS 1.x, 2.x Reitershan Comp.;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (MIO, Irata, etc.) up to 256 kbytes;

- X-DOS 2.x Stefan Dorndorf;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade drivers!) up to 256 kbytes;

B) Non-DOS programs:

a) Name(s) b) Author(s)
c) supported memory d) RD-type(s)

- A-Base 130XE (TOOL) ??? (author unknown);
64k, 128k 130XE-Ramdisk;

- ABBUC-Magazine-Intro 52 (DEMO) Karolij N./Heaven
64k, 128k 130XE-Ramdisk
(has different intros on 64k / 128k machines!)

- ABBUC-Magazine-Intro 55 (DEMO) Karolij N./Heaven
64k, 128k 130XE-Ramdisk
(with different intros on 64k / 128k machines!)

- Adalmar (GAME) F.Buettner (PPP);
64k, 128k 130XE-Ramdisk;

- Alphasys-Sample-Software (TOOLs) (Mirage+ANG);
a) 64k, 128k 130XE-Ramdisk;
b) 320k 26AE = YES!, 8ACE = ???;
(there are several programs for 64k or 128k memory; there
is also one -and only one- program for 320k Ataris)

- Anime 4ever (DEMO) Sente-Software-Group;
64k, 320k 26AE ???, 8ACE ??? ;
(on 64k Ataris all pics load from disk, on 320k Ataris from Ramdisk)

- A.R.-The Dungeon (GAME) P.Price/Datasoft;
48k, 64k, 128k 130XE-RD;

- A-Text (TOOL) ??? (author unknown);
64k, 128k 130XE-RD;

- Atari-Writer-80 (TOOL) (Atari);
48k, 64k, 128k 130XE-RD;

- Atari-Writer-Plus (TOOL) (Atari);
48k?, 64k?, 128k 130XE-RD;

- Basic-XE (TOOL) OSS/ICD/FTE
64k, 128k 130XE-RD;

- Bop N'Wrestle (GAME) (Mindscape)
64k, 128k 130XE-RD
(on 64k Ataris the floppy will never stand still!)

- [The] Brundles (GAME) A.R.+C.S.S. (KE-Soft);
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;
(merely copies the levels into the RD and loads them from there;
if you don't want to play all 100 levels at once, 64k is enough!)

- Datei 4.x (database TOOL) Norbert Schlia;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Desktop Atari (TOOL) H.B.S.F
64k, 128k RAM 130XE-RD;
(the Key "7" in the Main Menu copies the whole program into the RD)

- Diskcomm. 2.x, 3.x (TOOL) Robert "Bob" Puff;
a) extra RAM (answer with Yes) detects up to 10 banks (hex.)?;
b) Ramdisk (answer with No) all DOS 2, My-DOS and Sparta RDs;
(Ramdisk size depends on the DOS and RD driver you are using, i.e.
with TurboDOS up to 256k, with MyDOS or Sparta maybe up to 1 Megabyte)

- Diskworker 130XE (Tools) PETSOFT
64k, 128k RAM 130XE-RD;

- Extended-Atari-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Extended-Turbo-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Fampy 2.3 (Bootdisk; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Fampy 6.1i+ (ML-File; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Grafik+Sound Demo (DEMO) Dendrit-Soft/P.Sabath;
(48k?) 64k, 128k 130XE-Ramdisk;

- Howfen-DOS 3.x, 4.x (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Howfen-Tape-to-Disk (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Human Torch & The Thing Questprobe (SAGA+Marvel);
48k/64k, 128k RAM 130XE-Ramdisk
(The main program or some pics will be copied to the Ramdisk)

- Inertia 2.9 (TOOL) Mad Team;
a) 64k RAM (16k only) 16k usable memory (1 bank);
b) 128k RAM (16k+64k) 130XE-Ramdisk; (5 banks);
c) 320k RAM (16k+256k) 26AE & 8ACE RDs (17 banks);

- I.K. Plus Demo (GameDEMO) ??? (authors unknown)
a) 64k RAM only graphics;
b) 128k RAM graphics + sound;

- Megablast 1 (GAME) Thorsten Karwoth;
64k, 128k 130XE-Ramdisk;

- Midi-Mate II (Tool) Hybrid Arts;
64k, 128k 130XE-Ramdisk;

- Midi-Pattern-Editor (TOOL) Raster/Radek Sterba;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE-RDs?;

- Midi-Player (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Recorder (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Sequencer (TOOL) Maciej Sygit;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- MSC-IDE interface software (TOOLs) M.Belitz+S.Birrmanns;
64k, 128k 130XE-Ramdisk
(some programs/drivers use the Ramdisk, if no Ramdisk is
available, they will use & erase the RAM area 4000-7FFF)

- [The] Muppet-Movie (DEMO) Mad Team;
64k, 128k 130XE-Ramdisk;
(on 128k Ataris some pics are loaded from the Ramdisk)

- [The] Page Designer (TOOL) XLent
64k, 128k 130XE-Ramdisk;

- Paperclip II (TOOL) Batteries Included;
48k?, 64k, 128k 130XE-Ramdisk;

- Questprobe featuring Spiderman - see: Spiderman;
(afaik, THE HULK does not support 128k RAM);
- Questprobe featuring Human Torch and Thing - see Human Torch;

- Spiderman Questprobe (SAGA+Marvel);
48k/64k, 128k RAM 130XE-Ramdisk;
(The main program or some pics will be copied to the Ramdisk)

- Sweet Fantasy (DEMO) Tight;
64k, 128k 130XE-Ramdisk;
(on 128k machines the gr.9 pics are loaded from the ramdisk,
on 64k Ataris the gr.9 pics are loading from the disk drive);

- Syncalc "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

- Synfile "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

- Synhome "+" (TOOL) Synapse;
48k, 64k, 128k RAM and more Axlon-Ramdisks;

(other programs by Synapse should also support Axlon-Ramdisks)

- Textpro 5.x (TOOL) Ronnie Riche;
48k, 64k, 128k and more 130XE-RD, 26AE & 8ACE RDs;
(here the RD-bank Macros *.ADN and/or *.BNK will require extra RAM
/ Ramdisk; simply don`t use them if you merely have 48k or 64k !!)

- The Browser (TOOL) CTH / Tom Hunt;
64k, 128k and more all Sparta-DOS Ramdisks;

- The Top-3 Demo (DEMO) W.F.M.H.;
64k, 128k 130XE-Ramdisk;
(the dancing girl -"Veronika"- supports 64k and 128k memory!)

- Typesetter XL/XE (TOOL) XLent;
64k, 128k 130XE-Ramdisk;

- [The] X-Files Shpoon;
64k, 128k, 320k 130XE-RD, 26AE or 8ACE RDs?;

- thats all I remember right now...

Note: - Axlon means any Axlon compatible Ramdisk;
- 130XE means 128k memory (64k RAM + 64k RD);
- AE means 192k memory (64k RAM + 128k RD);
- 26AE means 320k memory (64k RAM + 256k RD)
=> Compyshop types (and compatibles, like Mathy`s RD);
- ACE means 256k memory (64k RAM + 192k RD)
=> Newell, Buchholz, Peterson, Rambo XL (and compatibles);
- 8ACE means 320k memory (64k RAM + 256k RD)
=> Newell?, TOMS, Peterson, Rambo XL? (and compatibles);
- ? means I am (generally) unsure -or:- I am not sure if
the given information is correct (just check it out!);

Thats all for now. Thanks and credits go to Russ Gilbert, Lee Barnes
Bernhard Pahl and Mathy van Nisselroy for sharing some info with me.
Any further help or info is welcome !! -Andreas Magenheimer.

Subject: 8.12) What programs require a RAMdisk?

This section by Andreas Magenheimer.

8.12 Atari-programs that require Extra-RAM / Ramdisk:
[This is version 2.10 from October 2003]

A) Non-Demo-Programs:

a) name(s): b) author(s):
c) memory (min.): d) RD-Type(s):
e) notes

- 130XE-(Bank-)Tester (TOOL) various authors (PD);
128k memory (64k RAM + 64k RD) 130XE-Ramdisk (E3,E7,EB,EF);
(1 block with 4 banks, overall: 4 banks);

- 192k-Memory-Tester (TOOL) various authors (PD);
192k memory (64k RAM + 128k RD) A,E Ramdisk blocks;
(2 blocks each with 4 banks, overall: 8 banks);

- 256k-Memory-Tester (TOOL) various authors (PD);
256k memory (64k RAM + 192k RD) A,C,E or 8,A,E blocks;
(3 blocks each with 4 banks, overall: 12 banks);

- 320k-Memory-Tester (TOOL) various authors (PD);
320k memory (64k RAM + 256k RD) 8,A,C,E or 2,6,A,E blocks;
(4 blocks each with 4 banks, overall: 16 banks);

- 576k-Memory-Tester (TOOL) various authors (PD);
576k memory (64k RAM + 512k RD) (overall: 32 banks);
(8 blocks x 4 banks -or- 4 blocks x 8 banks);

- 1088k-Memory-Tester (TOOL) various authors (PD);
1088k memory (64k RAM + 1024k RD) (overall: 64 banks);
(4 blocks x 16 banks for Mathy van Nisselroy`s RD and maybe others);
(8 blocks x 8 banks for Newell, Peterson, TOMS and compatibles);
(16 blocks x 4 banks should also be possible, but do not exist yet!);

- 2112k-Memory Tester (TOOL) Satantronic`s XRAM 0.18;
2112k memory (64k RAM + 2048k RD) (overall: 128 banks);
(8 blocks x 16 banks -or- 16 blocks x 8 banks);

- 4160k-Memory-Tester (TOOL) ??? (authors unknown);
4160k memory (64k RAM + 4096k RD) (overall: 256 banks);
(16 blocks x 16 banks, means blocks 0-F each with banks 0-F);
(note: with 1 PIA chip the main RAM 4000-7FFF is not available!);

- 8256k-Memory-Tester (TOOL) ??? (authors unknown);
8256k memory (64k RAM + 8192k RD) (overall: 512 banks);
(afaik, this upgrade requires 2 PIA chips or some uncool tricks!);

- 16448k-Memory-Tester (TOOL) ??? (authors unknown);
16448k memory (64k RAM + 16384k RD) (overall: 1024 banks);
(afaik, this upgrade requires 2 PIA chips or some uncool tricks!);

=> Note that 2MB-16MB extra RAM / Ramdisks are very uncommon
in the Atari scene! These upgrades were once sold by ICD and
Newell (maybe a few ones also by FTE) and of course they were
and still are selfmade by some crazy Atarians. It is not clear
if there is any software (games, apps., demos) available, that
supports these mega-upgrades fully. Afaik, only few Atarians
have and use them, mostly users of mailboxes / BBS`es...;

- APC-Archiver 1.0 (TOOL) LBS/APC;
320kbytes minimum memory 26AE = no!, 8ACE = YES!;
(It seems like this program does not work on Ataris which have
more than 320kbytes of RAM, i.e. it crashes on my 576k Atari)

- APC-Packer 1.1 (TOOL) LBS/APC;
320kbytes minimum memory 26AE = no!, 8ACE = YES!;
(It seems like this program does not work on Ataris which have
more than 320kbytes of RAM, i.e. it crashes on my 576k Atari)

- Atari Writer Plus Super Menu Ken Siders;
a) AWP + Super Menu 128k RAM 130XE-Ramdisk;
b) AWP-XE + Super Menu 256k RAM 26AE = ???, 8ACE = ???;

- ATOS/ATari Operating System (TOOL) CTH / Tom Hunt;
64k RAM + 16MB-HDD-Partition all Sparta-DOS Ramdisks;

(the standard system is configured for a 16MB harddisk partition,
however it is possible to change this and use an Atari with a big
floppy drive and/or ramdisk; but this requires quite some work!)

- Audio/Studio Master ANG/Mirage;
minimum 320k RAM 26AE = YES!, 8ACE = ???;
(the program is a part of the 4Bit A/D converter software!)

- Boot-Majster (TOOL) Electron;
128k RAM 130XE-Ramdisk;

- Boss-X - Version 10.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- Boss-XE - Version 8.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- CAD-XE (TOOL) (HAPS-PD 0350);
128k RAM 130XE-Ramdisk;

- Castle of Blackthorne (GAME) L.o.D. / Thimo Graef;
128k RAM 130XE-Ramdisk;

- Cavepack (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Computer Baseball (GAME) Douglas Blackwell
128k RAM 130XE-Ramdisk

- Degas-View-XE (Tool) Mat*Rat / Mathew Ratcliff;
128k RAM 130XE-Ramdisk;

- Diskettenverwaltung 130XE (TOOL) (ABBUC PD 86);
(database 130XE) 128k RAM 130XE-Ramdisk;

- Draw XE (TOOL) (ABBUC PD 387);
128k RAM 130XE-Ramdisk;

- Dream Vision (TOOL) (ABBUC PD 480);
(IFF-Viewer) 256k RAM 26AE = YES!! ; 8ACE = ??? ;

- Filemanager/Filecopiers (TOOLS) various authors (PD);
128k=> 1 floppy is enough Sparta and DOS 2.x RD`s;

- Fraktale & Colorprint (TOOLS) (ABBUC PD 349); P.Woetzel;
(fractals & colorprint) 128k RAM 130XE-Ramdisk;

- Gizmo`s Castle (GAME) Black Panther / M. Kugler
XE-Version = 128k RAM 130XE-Ramdisk;

- Grafik-Zeilen-Editor (TOOL) (HAPS PD 0296);
(graphic-line-editor) 128k RAM 130XE-Ramdisk;

- Hi-Res Designer (TOOL) (HAPS PD 0015);
(gr.8 drawing program) 128k RAM 130XE-Ramdisk;

- Hires-Dump (TOOL) (ABBUC PD 113);
(gr.8 print-program) 128k RAM 130XE-Ramdisk;

- Inertia 4.5 (MODplayer TOOL) MadTeam
a) 128k RAM 130XE-Ramdisk
b) more than 128k RAM 26AE = YES!, 8ACE = YES!;

- Kaiser II (GAME) Phoenix Softcrew / C.Strotmann;
a) 64k RAM Version any 64k XL/XE computer;
b) 128k RAM Version 130XE-Ramdisk;
c) 320k RAM Version 26AE = YES!, 8ACE = YES!;
(this game comes in 3 separate versions; plays good on 64k
computers, but needs less disk-swaps on bigger machines !!)

- Kassettencopy (TOOL) (ABBUC PD 466); J.Gernreich;
(Cass.copy) Copy64 = 128k RAM 130XE-Ramdisk;

- Kemna-Video (TOOL) (ABBUC PD 185);
(intro-creator) 128k RAM 130XE-Ramdisk;

- Koala Slideshow XE (TOOL) Charles Johnson/Analog
128k RAM 130XE-Ramdisk

- Koenigsdiamanten (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Lightraces (Game) (Power per Post);
XE-Version = 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE 4.32 (TOOL) (ABBUC PD 297); T.Karwoth;
(older version!) 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE+ 2.x (TOOL) (ABBUC PD 368); T.Karwoth;
(newer version!) a) 128k RAM 130XE-Ramdisk (MyDOS only!);
b) 128k - 1088k (MyDOS only!) 26AE = YES!! ; 8ACE = YES!! ;
(has a rambank-finder program that can be loaded from Basic or the
menu!; the assembler does not work on a CS ramdisk with refresh bugs!)

- Masher-XE V1.0 ??? (author unknown);
minimum 128k RAM 130XE-Ramdisk;
192k, 256k and max. 320k RAM AE, ACE and max. 8ACE RDs;

- Memdrv10 (RAM-Tester TOOL) Andre 'MacFalkner' Bertram
$D301 all Portbits 16k up to 4 MB (all standard RD`s);
$D600 up to ??? MB (Klaus Peters Megaram 3 Ramdisk)
includes 16k Bankswitching and exotic 32k (Buchholz) Bankswitching

- Menu 130 (TOOL) Les Howarth/Page 6
128k RAM 130XE-Ramdisk

- Midi Mate III Hybrid Arts;
128k RAM 130XE-Ramdisk;

- Minesweeper 1-4 (GAMEs) J.R.Chiko/S.A.S.;
128k RAM (4 game versions) 130XE-Ramdisk

- Mister X (Game) (Power per Post);
128k RAM 130XE-Ramdisk;

- Monitors, Debuggers & more (TOOLS) (HAPS PD 0109);
some programs require 128k RAM 130XE-Ramdisk;

- Multi-DOS 130 (TOOL) Kuchera/Excellent;
128k RAM 130XE-Ramdisk;

- Multi-DOS 320 (TOOL) Kuchera/Excellent;
320k RAM 26AE = ???, 8ACE = ???;
(note that Multi-DOS 130 and 320 are no DOS-Versions, they can
be used as *.CMC players; all the rest is unknown to me...)

- Multi-Tasking-OS (various ABBUC magazines);
128k RAM minimum 130XE-Ramdisk (+ST-mouse);

- MTOS XE (Tool) CTH / Tom Hunt;
128k RAM 130XE-Ramdisk;

- MTOS 256 (Tool) CTH / Tom Hunt;
256k RAM (64k+192k) 26AE = NO!! , 8ACE = YES!!;

- [Der] Neffe (Game) (ABBUC PD 52);
(the Nephew) XE-Version = 128k RAM 130XE-Ramdisk;

- Neo-Tracker (TOOL) EPI/Allegresse;
192k RAM minimum 26AE = ??? , 8ACE = ???;

- [The] Newspaper-Editor (TOOL) (HAPS PD 0294 english!);
XE-Version = 128k RAM 130XE-Ramdisk;

- Oelbaron (Game) ??? (author unknown);
XE-Version = 128k RAM 130XE-Ramdisk;

- Programmverwaltung 130XE (TOOL) (HAPS PD 0434);
(database 130XE) 128k RAM 130XE-Ramdisk;

- Protracker 1.5 (TOOL) MadTeam;
128k RAM minimum 130XE-Ramdisk;

- (various) Ramdisk drivers (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- Rechnen fuer Kinder (TOOLs) (ABBUC PD 85);
(calculations for children) 128k RAM 130XE-Ramdisk;

- Rund um die Ramdisk (TOOLs) (ABBUC PD 383, HAPS PD 1084);
(RD-testers, etc.) 256k RAM and more various XE-RD`s & Axlon-RD`s;

- Sample-Art-XE Mozart/WSL
a) minimum 128k RAM 130XE-Ramdisk;
b) more than 128k RAM 26AE = ???, 8ACE = ???;
(on my 576k-XL the program has some gr.-bugs and crashes very often!)

- Shrink-XE Peter Fitzsimmons;
min. 128k RAM 130XE-comp.-Ramdisks;

- [The] Small Printery (TOOL) Walter Lojek;
128k RAM or more (up to 1MB) 130XE-Ramdisk (minimum!);

- Snapshot (Tool) ??? (author unknown);
128k RAM 130XE-Ramdisk;

- [The] Sound-Utility (TOOL) CTH / Tom Hunt;
(64k), 128k, 256k, 576k, 1MB 130XE-RD; 8,A,C,E Ramdisks;

- Space Harrier (Game) Sheddy / Chris Hutt;
128k RAM 130XE-Ramdisk;

- Strategy Baseball (Game) (HAPS PD 0302);
128k RAM 130XE-Ramdisk;

- Studio/Audio Master ANG/Mirage
minimum 320k RAM 26AE = YES!, 8ACE = ???;
(the program is a part of the 4Bit A/D converter software!)

- Super-Print-Lab-XE (TOOL) (HAPS PD 0909);
(demo-version) 128k RAM 130XE-Ramdisk;

- System+Memory Tester (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- T-34 (Game) (ANG / Mirage);
128k RAM 130XE-Ramdisk;

- (various.) Tape-Copiers (TOOLs) various authors (PD);
128k RAM 130XE-Ramdisk;

- Tape-Ramdisk-Drivers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- Text-130 (TOOL) B.Russmann;
128k RAM 130XE-Ramdisk;

- Textpro "+" (TOOL) Ronnie Riche;
(e.g. Vers. 4.54+) 128k RAM 130XE-Ramdisk;

- The Code Cruncher (TOOL) Soused Teat / A.Bienias;
128k RAM and more XE-Ramdisks;

- The Cruncher 5.0 (Tool) MSL / Magnus;
128k RAM and more XE-Ramdisks;

- The [Sparta DOS] Wedge (TOOL) Ed Bachman;
128k RAM and more + sep. Antic! XE-RD`s with separate Antic!;

- The Works (Tool) CTH / Tom Hunt;
128k RAM and more 130XE and A,C,E Ramdisks;

- [Die] Wuerttemberger-Disk (TOOLS) (ABBUC PD 361, HAPS PD 1050);
also contains the XE-version of Gizmo`s castle => see Gizmo`s Castle!;

- (various) XE-Sectorcopiers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- XE-Utilities (10 XE-TOOLs) (HAPS PD 0031);
128k RAM 130XE-Ramdisk;

- XL-2 (Tool) John K. Picken;
128k RAM and more all Sparta und DOS 2.x RD`s;

- Zargon (german text-adv. GAME) (ABBUC PD 611, HAPS PD 0485);
128k RAM 130XE-Ramdisk;

- [Der] Zeitungsredakteur (ABBUC PD 121, german!);
(newspaper-editor) 128k RAM 130XE-Ramdisk;

B) Demo-Programs:

- 130XE-Artshow (Koala!) (HAPS PD 0013);
128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k Ataris!)

- 130XE-Autoshow (Oldtimers!) (ABBUC PD 191, HAPS PD 0637);
(130XE carshow) 128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k Ataris!)

- 130XE-Demo S.A.G. (Netherlands);
128k RAM 130XE-Ramdisk;
(written in TB; change all D8: entries into D1: for use with 48k and
64k Ataris; exchange Turbo-Basic XL with TB 3.2q, TB 400 or Frost
Basic for use with older 48k Ataris or (most versions of) Sparta-DOS)

- 130XE-Impossible-Demo Rudy Haegemann / V.T.B.;
128k RAM 130XE-Ramdisk;

- Amiga-Boink-XE Bob Armour;
128k RAM 130XE-Ramdisk;

- American Natives Fox-1 / R.Verdaasdonk;
256k RAM all DOS 2 und MyDOS RD`s;

- (X-Files) Animation-Demo Mad Team;
128k RAM ($04 banks / $4b frames) 130XE-Ramdisk;
(the real name of this demo is unknown to me; maybe it is also called
X-Files-Demo, like the X-Files (picture) demo by Sphoon, maybe it has
a different name; on all tested XL/XE Ataris this demo has graphic bugs)

- Animkomials meet Boris Valleyo Animkomials+Boris Valleyo;
128k RAM (gr.9+11 pictures!) 130XE-Ramdisk; (has a setup!);

- Base-33 AIDS / AIDZ;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> hold down SHIFT upon bootup to get to the Setup-menu!)

- Bill-Pie-Demo ??? (maybe Mad Team?);
a) 128k RAM ($1E frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($36 frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($4C frames) RD-blocks 8+A+C+E (TOMS, etc.);

(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop or compatible RD can merely see the 192k version!)

- BMW-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- CES-XE-Demo XANTH (full version);
128k RAM (580 sectors) 130XE-Ramdisk;

- Cogito-Demo AIDS / AIDZ;
192k RAM 26AE = no?! ; 8ACE = YES!! ;

- Comet-Ani MadTeam;
a) 128k RAM ($36 frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($6D frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($96 frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop RD and compatible can merely see the 192k version!)

- Critical-Sound-Demo Innovative;
128k RAM 130XE-Ramdisk;

- Danielle-(Gr.9-TB-)Ani NBS / Bill Kendrick;
a) 64k RAM (499 sectors) Disk = very slowww!;
b) 128k RAM or Harddisk RD/HD = much faster !!;
(=> use your favourite DOS, Turbo-Basic and a RD/HD driver!)

- Edelweiss-Demo A.R. + C.S.S. + S.V.L.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s you can see all demo-parts, however the mainpart,
known as the Edelweiss-Digi-Sample is shorter & sounds strange!)

- Ergo-Bibamus Quasimodos;
128k RAM (with Setup!) 130XE-Ramdisk;
(well, for 130XE and compatible Ramdisks no setup needed!)

- Extract-Slideshow Bit Busters / Replay;
128k RAM 130XE-Ramdisk;

- Glasshead / HTPPD A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Halle 1994b: The Wormhole Magic Arts;
320k RAM 26AE = YES!! ; 8ACE = NO!! ;
(well, this demo does not work at all on 8ACE-Ramdisks!)

- (Atari) Hardware-Demo A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Igor Demo MadTeam;
a) 128k (Part 1, Part 2) 130XE-Ramdisk;
b) 192k (Part 3) 26AE = YES!! ; 8ACE = YES!! ;

c) 320k (Parts 1+2+3) 26AE = NO!! ; 8ACE = YES!! ;
(=> the demo normally runs a setup for 320k memory; but there are 2-3
batch files for each Setup; goto DOS and install the one you want or
need with the JOB command: JOB @xxxx.BAT [RETURN], then reboot disk)

- Imperial (Sounddemo) Innovative;
320k RAM 26AE = YES!! ; 8ACE = YES!! ;

- Impossible but Real! MacGyver / AIDS;
256k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> press A for 8ACE-RDs, press B for manual setup of other RDs)

- Isolation Demo Masters of Electric City;
128k RAM 130XE-Ramdisk;

- Journey Polynomials
a) 128k RAM ($36 frames) 130XE-Ramdisk;
b) 320k RAM ($96 frames) 26AE = YES!! ; 8ACE = yes!? ;
(=> this demo chooses the Ramdisk & Setup automatically! the demo
has quite some graphic bugs on 8ACE ramdisks, but is viewable!)

- Journey into Sound DGS / Dean Garaghty;
128k RAM 130XE-Ramdisk;

- Khai-Et AIDS / AIDZ;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> hold down SHIFT key upon bootup for the Setup-menu)

- Killer-Whales MadTeam
a) 128k RAM ($2E frames) 130XE-Ramdisk; RD-block E;
b) 192k RAM ($54 frames) RD-blocks A+E (CS, Rambo, etc.);
b) 320k RAM ($94 frames) RD-blocks 8+A+C+E (TOMS, etc.);
(=> this demo chooses the Ramdisk & Setup automatically! users of
a Compyshop RD and compatible can merely see the 192k version!)

- Lajf-Demo MadTeam;
128k RAM 130XE-Ramdisk;

- Landscape-XE-Demo Karl Pelzer;
128k RAM 130XE-Ramdisk;

- Megablast-Sounddemo DGS / Dean Garaghty;
128k RAM 130XE-Ramdisk;

- MTV`s-Danielle see: Danielle-Ani.;

- Nascar-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- Nonjm-Demo TIGHT;
128k RAM 130XE-Ramdisk;

- Numen-Demo Taquart;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> the newer/updated version has an auto-setup for 26AE & 8ACE RD`s!)

- Owca-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Owca-2-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Parrot-X-MAS-Demo Anthony Ramos;
128k RAM 130XE-Ramdisk;

- Pedrokko-Sounddemos Pedrokko (10 Disks / 20 S.);
128k RAM (some demos) 130XE-Ramdisk;

- P.I.T. - Demo Quasimodos;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> a menu appears automatically; setup 15 banks to run the demo!
this demo does not work correct on Ramdisks with refresh-bugs!)

- Raving Vierpz Pentagram;
128k RAM 130XE-Ramdisk;

- Raytracing 320k Elsni/Stephan Elsner;
320k RAM (TB listings!) 26AE = NO!! ; 8ACE = YES!! ;

- Raytracing 1MB Solocoder of A.C.E.;
1088k RAM (K.Peters Megaram 3) works only on K.P.-1MB-RD !!;
(=> Bootdisk with 8 disksides; loading time: approx. 17 minutes!)

- Raytracing Animation Karl Pelzer;
128k RAM 130XE-Ramdisk;

- Revenge of Hacker Rasero Team;
192k RAM (RD-blocks A+E) 26AE = YES!! ; 8ACE = YES!! ;

- Sweet Fantasy TIGHT;
128k RAM 130XE-Ramdisk;

- Sheol Bit Busters;
320k RAM 26AE = NO!! ; 8ACE = YES!! ;
(on 26AE / CS - Ramdisks you will merely receive an error
message like this: sorry, this demo needs 256k of xms RAM)

- Shiny-Bubbles-XE Brian Paul / LACE;
XE-Version = 128k RAM 130XE-Ramdisk;

- Stash-Demo Rasero-Team;
320k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> in the first menu press A for 8ACE Ramdisks or press B for
manual setup of other Ramdisks like Compyshop; in the second menu
press A for 8ACE Ramdisks or C for manual input of Rambanks; don`t
press B -Compyshop- here, since this CS setup is faulty/wrong)

- Starwars-Demo A.R. + C.S.S.;
320k RAM (hold down Option-Key!) 26AE = YES!! ; 8ACE = yes!? ;
(the program checks if Basic is disabled via the Option key, thus
an OS with inverted Basic / Option-key function does not work here!;
with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- The Asskicker Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- The Turtles-Demo (Animation!) Ultra-Software;
128k RAM 130XE-Ramdisk;
(the file version by John E. requires 128k, maybe this bootdisk also)

- The Wormhole Magic Arts;
320k RAM 26AE = YES!!, 8ACE = NO!!;
(this demo is part of the Halle Project 1994 demo, side B!)

- Timekeep(er) New Generation;
320k RAM ??? 26AE = NO!! ; 8ACE = YES!! ;
(after loading on an 8ACE-RD be patient! the demo requires some time
for depacking - don`t switch off when you see a black screen, wait!)

- Tit-Demo MadTeam;
256k RAM (with Setup!) 26AE = YES!! ; 8ACE = YES!! ;
(=> the Setup appears automatically; accept or change it !)

- Too-Hard-2 Animkomials (Rippers!);
128k RAM 130XE-Ramdisk;

- Too-Hard-3 Animkomials (Rippers!);
192k RAM 26AE = YES!! ; 8ACE = YES ;
(=> the Setup appears automatically; accept or change it!)

- Too-Hard-4 Animkomials (Rippers!);
320k RAM 26AE = YES!!, 8ACE = YES!!;
(=> the Setup appears automatically; accept or change it!)

- Total Daze TIGHT;
128k RAM 130XE-Ramdisk;

- Trabant Demo / HTPPD A.R. + C.S.S.;
320k RAM 26AE = YES!! ; 8ACE = yes!? ;
(with 8ACE-RD`s the animation uses only A+E blocks and is shorter!)

- Trip-6-Demo Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- Ultra Taquart;
128k RAM 130XE-Ramdisk;

- Vengeance Excellent;
128k RAM 130XE-Ramdisk;

- Vent Excellent+Pentagram;
128k RAM 130XE-Ramdisk;

- Video Blitz Helvetica Bold;
128k RAM (+sep. Antic!) 130XE-Ramdisk + sep. Antic!;

- WAF-Demo (Side B) ABBUC regional group W.A.F.;
128k RAM (2 Parts!) 130XE-Ramdisk;
(=> here the Raytracing and Vector part require 128k memory!)

- Worms-Demo Datri;
320k RAM 26AE = yes!? ; 8ACE = YES!! ;
(with 8ACE-RD`s you see the complete+bug-free version; with 26AE
RD`s you see a shorter and very buggy version with many deja-vues!)

- X-Demo Mad Team;
320k RAM 26AE = YES!! ; 8ACE = NO!! ;

- Xyberscape-XE Bill Le Masurier;
128k RAM 130XE-Ramdisk;

- Zero-Demo New Generation;
128k RAM 130XE-Ramdisk;

Notes: - 256k Compyshop-Ramdisks, 256k K.Peters-Megaram 1,2,3
and Mathy`s 1024k RD have/use 26AE Ramdisk blocks;
- afaik all other 192k / 256k Ramdisks have ACE (8CE)
or 8ACE blocks (Newell, Peterson, Buchholz, TOMS, etc.);
- ??? means unknown; TB means Turbo-Basic (XL);
- HTPPD means Hobby-Tronic-Power-Pack-Demo;
- YES!! means the demo works as it should (100% correct);
- yes!? means the demo works but has some bugs or is shorter
(50-80% correct);
- no?! means the demo almost does not work and has many bugs
(10-40% correct);
- NO!! means the demo does not work at all - it refuses to load
or crashes shortly after loading (0% correct);
- sep. Antic means separate Antic access of the Ramdisk;
(only 2 programs seem to exist: Video Blitz & The Wedge);

Thanks and credits go to Russ Gilbert, Bernhard Pahl and Mathy van
Nisselroy for sharing their info with me. Any corrections and/or updates
are welcome... - Andreas Magenheimer

Subject: 8.13) What voice/sound synthesis software is there for the Atari?

This section by Andreas Magenheimer.

- S.A.M. - the Software Automated Mouth by Don't Ask Software (a
software package; you can find it at Don`s / the author's homepage:
http://www.retrobits.net)
- Softsynth (a PD program, that creates sounds and sound effects via
modulation of the tv/monitor speaker; available from the ABBUC library);
- MOD-Sounds (sound-MODulation, allthough I do not know any software to
create such sounds on an A8, some programs to edit (Protracker) and
playback (Inertia, Modplayer, Neotracker, etc.) these sounds do exist);

Subject: 8.14) What programs support stereo and upgraded sound?

This section by Andreas Magenheimer.

There is already a lot of stereo software for the upgraded Atari computers available, of course most of these programs are limited to certain/special upgrades and merely perform their stereo effects on these items (with otherwise upgraded or non-upgraded Ataris, the sounds or programs will only play in mono):

a) software for the various stereo-upgrades:

- stereo with one Pokey (POPS-software): Afaik for this kind of upgrade, there merely exists a patched version of the Pokey player program, I am not sure if there is anything else for it; anyway, refer to Analog Computing, issue 66, november 1988, pages 54 -60;

- stereo with two computers (thus two Pokeys): Afaik for this simple trick there merely exist two programs, they are "Perestroyka" and "Sky Network" by T.Liebich. In order to achieve the stereo effect, you have to boot/load one of these demos on two computers (connected to different TV's or monitors, there is no need to connect the computers to each other!). When done, press 1-5 on the first computer while pressing Shift-1-5 on the second computer. Meaning, if you want to hear the first sound in stereo then press 1 on computer 1 and press Shift-1 on computer 2 simultanously (that`s a little tricky, I know). If you want to hear sound 5 in stereo, then press 5 on computer 1 and Shift-5 on computer 2 simultanously. Tricky at first, but sooner or later you will get the hang of it. Of course you can also connect the two Ataris to a hifi-system, using the sound output of one Atari for the left channel and the sound output of the other Atari for the right channel...

- stereo-sound with Stereo-Blaster Pro (Portronic/AMC): Afaik there was at least one demo disk (early version was single-sided only, later versions were double-sided), that contained some demo-software, namely the simple "Stereo-demos" (by AMC, side 1) and the "Stereoblaster-Demo" (by HU-Soft, side 2 if available). The Stereoblaster demo was written in Turbo-Basic and played back via Compiled-Turbo-Basic, it uses Chaos Music-Composer Sounds (*.CMC) and a few of these provide stereo effects, if equipped with a stereo-blaster-pro and a hifi-system. The simple stereo-demos included some programs written in Atari Basic, for example a (pong-like) bouncing ball and a flying helicopter. Equipped with a stereo-blaster-pro and a hifi-system, one could see the ball bouncing left and right and simultanously hear the sound fx on the left or right channel. The helicopter started at the left side and produced a loud sound on the left channel, when it was flying to the right side, the sound faded on the left channel and got louder on the right channel, until the helicopter disappeared (and the sound completely faded away). There were some more of these simple demos available, but I don`t remember them anymore.

- Stereo with two Pokeys: There already exist dozens of sounds and demos, that support this upgrade, most of these programs were made in Poland, but a few sound-demos were also made in other countries. Anyway, the following programs support stereo via two Pokey chips:

- Alf-Demo by the Unknown Base (Netherlands);
- Alpha-Demo by GMG (Slovakia);
- AMS-Stereo player by ??? (author unknown), USA;
(there are at least two AMS-stereo-players, that let you play
*.AMS sounds in true stereo or at least simulated stereo!);
- ARS-Mori 16k Intro by Tristesse (music shortened and ripped from
Drunk Chessboard by Infinity!), Poland of course;
- Ballada sound by DJ V / BK (Poland);
- Base 33 by AIDS (msx by Greg, Poland);
- Chaos Music Composer version x.x patched by ??? , Poland;
(=> the original version by Janusz Pelc / LK Avalon is only mono,
but there is a patch available, as well as various patched CMC
versions on the internet; thus *.CMC sounds can be generated in
stereo!);
- (many) *.CMC sounds created by one of the many stereo-versions of
Chaos Music Composer;
- Cogito-Demo by AIDS (Poland)
- Do you see the light? sound-demo by Roemer of UNO (Germany);
- Draconus, patched version by ANG and/or Micro Discount (NL/UK)
(the original version by Zeppelin games is only mono!);
- Drunk Chessboard by Infinity (music by X-Ray!), Poland;
- Dynakillers (Game) by GMG, Slovakia;
- First of All (sound) by Raster, Czech Republic;
- Impossible but Real Demo by MacGyver (Poland);
- King of Aggregat by X-Ray / Slight (Poland);
- Megaplayer Versions 1.6 and 2.0 by MacGyver (Poland)
(=> and thus all *.CMC, *.MPT, *.TMC, etc. sounds played with
this sound-player tool can be heard in true or simulated stereo!);
- Multi-Pro-Tracker 2.4 (various versions) by Jaskier/Taquart?
(=> thus *.MPT sounds can be generated in stereo!), Poland;
- (many) *.MPT sounds created by the stereo-version of Multi Protracker;
- Nazebany by DJ V / BK (Poland);
- Overload sound by X-Ray / Slight (Poland);
- Raster Music Tracker 1.x by Raster, Radek Sterba (a PC program
that creates mono/4-channels or stereo/8-channels *.RMT sounds that
can be played back on the A8 or any Atari 800/XL/XE emulator);
- (most) *.RMT sounds created by Raster Music Tracker;
- Stereo-Patch for Pokey Player by ??? (author unknown)
(=> thus all Pokey-Player / *.V sounds can be heard in stereo!);
- Stereo-Patch for Softsynth by Freddy Offenga (Netherlands)
(=> thus Softsynth will create stereo-sounds!);
- Stereo Patch for World of Wonders by Freddy Offenga (Netherlands)
(World of Wonders is a great Softsynth sound-demo!);
- Still Alive (TMC-sound) by Greg, Poland;
- Time sound by X-Ray / Slight (Poland);
- Theta-Music-Composer version 1.x by Greg (Poland)
(=> thus *.TMC sounds can be generated in stereo!);
- (most) *.TMC sounds created by Theta Music Composer;
- Vanity sound by Kuchara / Excellent (Poland) ;
- Worms (320k-Demo) by Datri, Czech Republic;
- Zybex, patched version by ANG and/or Micro Discount (NL/UK)

(the original version by Zeppelin games is only mono!);
- thats all what I found so far... (A.M.)

b) software for other sound enhancements:

- enhanced-sound with Covox: Afaik this upgrade will playback digitised or sampled sound in 8Bit resolution rather than in 4Bit resolution. The following programs support the Covox-Upgrade:
- Inertia 2.9, a MOD-player by MadTeam;
- Inertia 4.5, a MOD player by MadTeam;
- Protracker x.x, a MOD-editor and player by ???;
- NeoTracker 1.x, a MOD+NEO+... player by EPI/Allegresse;
- that's all I have found so far;
note that all programs (except neo-tracker?) will still work with pokey...;

Subject: 8.15) What games support online action via modem?

This section by Andreas Magenheimer.

- Modem Chess, a PD game in Basic by ???
- Modem-Battleships, a PD game in Basic by ???
- Tele-Chess, a PD game in Basic by ???
- probably some more games...

(I have also seen an advert from GCP in Analog or Antic, that listed the following games: The City, Cybertank, Cybership, Bio-War, Lords of Space; I am not sure if they are all available for the Atari, A.M.)

To play these games online, one would not only require an Atari computer, but also a modem, a modem-driver and/or a terminal program (like Kermit, Bobterm, Teleterm, A-Term, Ice-T, BBS Express Pro, etc.). See also the sections 7.8, 10.1 and 10.2 which tell you more about modem/terminal programs and modem hardware for the Atari...

Subject: 8.16) What programs support Atari computer networking?

This section by Andreas Magenheimer.

There are two different hardware add-ons which provide a "computer-network" (two or more Ataris linked together). Thus, there is software that supports either one or the other hardware (namely Gamelink-1 or Gamelink-2). The following software supports the networking hardware:

- Gamelink-1 (by Dataque):
- info-text about GL-1 and where to buy it, by Dataque;
- Tic-Tac-Two by J.Potter/Dataque, a tic-tac-toe clone;
- Modem-Battleships, patched by Rick Detlefsen for Gamelink-1;

- Gamelink-2 / Multilink (by Dataque & Bewesoft):
- info-text about GL-2 and where to buy it, by Dataque;
- info text about Maze of Agdagon demo, by Dataque;

- Maze of Agdagon demo (1 player only) by Dataque;
- documentation for Maze of Agdagon (full version) by Dataque;
- Maze of Agdagon (full version, 2-8 players) by Dataque;
- description of multilink/gamelink-2 hardware and schematics by Bewesoft (two texts, one in czech and one in english; schematics presented as an Atari Gr.8 picture for a) easy-2-computer hardware and b) more complicated 2-8 computer hardware);
- Multi-Dash (2-8 players, XL/XE only) by Bewesoft;
- Multi-Race (2-16 players, XL/XE only) by Bewesoft;
- description of "how to program networking games for multilink [gamelink-2] hardware" (text available in english and czech, with lots of source codes and OS adresses/variables/...) by Bewesoft;
- Multi-Worms (2-8 or 2-16? players, XL/XE only) by Bewesoft;
- complete + documented source code for Multi-Worms by Bewesoft;
- "starter-kit" module to use in your own networking-games by Bewesoft (free use of this module is granted by Bewesoft/Jiri Bernasek);

Subject: 9.1) How can I work with .arc files on my 8-bit Atari?

ARC.EXE for MS-DOS was released by System Enhancement Associates (SEA) around 1985. It will compress and store groups of files as one file, making it easier and quicker to download programs and support files at once. Because of the ease of use and availability of this program, it quickly became the defacto standard for file archives on Intel-based IBM machines. Files compressed and stored with ARC or a compatible utility are normally given the filename extender ".arc".

The 8-bit Atari computers have several software utility options that are fully compatible with ARC.EXE, the most important being:

Super UnArc 2.4 and Super Arc 2.4 - shareware by Bob Puff, released 01/31/89
Available:
http://www.nleaudio.com/css/files/superarc.arc (complete package + docs)

Also, SpartaDOS X includes a fully compatible ARC command for both creating and extracting .arc files.

Subject: 9.2) What file formats for entire disks/tapes/cartridges are there?

It is now common, especially when working on Windows PCs or Macs, to work with Atari software as files or "images" containing the data from an entire disk, data cassette, or cartridge as duplicated from the native media for the Atari.

Here is a list of file formats, arranged by their associated filename extensions. These are all filename extensions used to name files containing entire 8-bit Atari floppy disk images, cassette tape images, or cartridge images.

.DCM -Image format invented by Bob Puff for his Disk Communicator 3.2 utility. Used when working with native Atari hardware.

DISKCOMM is at http://www.nleaudio.com/css/files/DISKCOM.ARC
DCM specs at: http://home.planet.nl/~ernest/diskcomm.zip

.ATR -Image format invented by Nick Kennedy, for his SIO2PC project.
Used with most 8-bit Atari emulators running on other computer
platforms. SIO2PC is at http://www.tcainternet.com/wa5bdu/

.XFD -Image format invented by Emulators Inc, for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used with ST Xformer and PC Xformer emulators.
Xformer is at http://www.emulators.com/

.PRO -Image format invented by Steven Tucker, for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.
APE and APE ProSystem are at http://www.atarimax.com/

.SCP -SpartaDOS SCOPY image file. SCOPY was a utility by ICD.

.DI -Image format invented by Kolja Koischwitz & Christian Kruger for their
800XL DJ emulator for the Atari ST.

.CAS -Cassette image format invented by Ernest R. Schreurs, for his
Digital Cassette Image system (includes CAS2SIO, WAV2CAS, and CAS2WAV
MS-DOS utilities. See: http://home.planet.nl/~ernest/

See also:
Atari Disk Image FAQ (Steve Tucker)
http://www.atarimax.com/ape/docs/DiskImageFAQ/

One tool for converting among all of these disk image formats is:
Acvt v1.07 by Jindrich Kubec, found at http://jindroush.atari.org

---

Subject: 9.3) How can I copy my copy-protected Atari software?

Russ Gilbert writes:

Almost all commercial software for the A8 is/was copy protected. For boot
disks, this usually involved a large number of special formatting that
couldn't be copied using ordinary sector copiers. Usually the boot process
involved checking to see if a certain sector error occurred, then proceeding.
If the error did not occur, the disk was a copy and would not work.

For carts, usually the method of protection was to write to the cart area of
memory and see if the value changed. If the value changed, the cart program
was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at
which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption,
which must be decrypted before the program can run. This to make more
difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk, including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE ProSystem, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a cable, called the SIO2PC cable, that connects the A8 13 pin serial port to a serial port on the IBM PC clone. To make 'Pro' images, a special adapter cable is needed, not just the 'standard' SIO2PC cable. The 'Pro' image can 'capture' the copy protection of an original commercial disk. The 'Pro' image can then be loaded into an A8 using the APE registered version software, thus backing up your original disk software. Note the 'Pro' image will only be of use to person(s) owning registered APE software and 'Pro' adapter cable.

Subject: 10.1) What programs can log in to other computers via modem?

Here are some of the more popular PD/freeware/shareware terminal emulator and related programs available. Use one of these programs for accessing a dial-up Bulletin Board System (BBS) with your Atari, or for accessing a dial-up "shell account" with your Internet Service Provider (ISP). Dial-up shell accounts are no longer widely available here in the 21st century! (There is no general-purpose PPP capability for the 8-bit Atari that I am aware of.)

ATAR-Z-MODEM 1.2, 5/29/94, shareware by Larry Black
Emulates: n/a
Text: 40 columns in gr.0
File Xfer: ZMODEM download
Autodial: No
Backscroll buffer: No
Capture-to-disk: no
Summary: Intended to be used as an external ZMODEM receive utility in conjunction with other terminal programs, especially BobTerm
http://www.umich.edu/~archive/atari/8bit/Telecomm/Protocols/atzmod12.arc

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 release that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
Available: http://www.nleaudio.com/css/ (version 1.21)
ftp://ftp.spudster.org/pub/atari/cth/terminal_programs/BOBTM122.ARC (com only)
http://people.a2000.nl/becotel/archive/bobt123.arc (1.23)

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
ftp://ftp.spudster.org/pub/atari/cth/terminal_programs/FLICK051.ARC

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)

Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
Available: http://www.cs.huji.ac.il/~itayc/

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: k65v37.arc ; k65doc.arc - docs ; k65src.arc - source

OmniCom by CDY Consulting (David Young)
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit
filename: omnicom.arc

PabQwk 2.0, 1 Feb 1994, shareware by Low-Budget Productions (Pab Sungenis)
Requires: 128K XL/XE
Emulates: n/a
File Xfer: QWK upload/download
Summary: The Professional QWK reader for the Atari 8-bits. (QWK is a
packet format created in the IBM BBS community for reading mail
offline.)
http://people.a2000.nl/becotel/archive/pabqwk20.arc

Term80 1.6 (8.25.95), by CTH Enterprises (Tom Hunt)
Requires: MIO or Black Box
Emulates: ANSI
Text: 80 columns in gr.8
File Xfer: XMODEM receive, YMODEM send/receive
Autodial: Yes
Brackscroll buffer: No
Capture-to-disk: Yes
Summary: Designed for calling IBM ANSI BBSs at the highest possible
speeds supported by the MIO and Black Box (14.4 Kbps)
Available: http://cth.dtdns.net/Featured/term80/term80.html

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed

Subject: 10.2) What programs can I use to host a BBS on the Atari?

The 8-bit Atari was particularly popular for hosting a dial-up Bulletin Board System (BBS). Uploading/downloading files, online messaging, even online gaming services can all be hosted on an 8-bit Atari operated as a dial-up BBS.

This section attempts to list all BBS programs for the Atari. Of these, BBS Express! Professional and Carina II BBS seem to be programs that stand up well even today.

Contributors to this section include: Winston Smith, Steven Sturza, Chad Hendrickson, Don Fanning, Matt Singer, Pete Davis, Jeff Williams

o AMIS BBS -- The Atari Message Information Service, public domain.
The "granddaddy" of BBS programs for the 8-bit Atari.

The AMIS BBS was written in BASIC by people from the Michigan Atari Computer Enthusiasts. It included designs for a ring-detector. You needed a sector editor and had to allocate message space by hand, hex byte by hex byte.

Several versions of AMIS:
* Standard AMIS
* MACE AMIS - from the Michigan Atari Computer Enthusiasts
* Fast AMIS
* MPP AMIS by Matt Pritchard
* TODAMIS 1.0, for 1030/XM301, 1986, Trent Dudley

o ATABBS -- Rod Roark writes (3/12/03):
This is really straining my memory -- don't recall exactly when I wrote the thing (maybe '80 or '81), but as far as I know ATABBS was the world's first BBS for the Atari 400/800.

I ran it out of my condo in Atlanta on a 48K 400 with an 80K floppy drive and a 300 bps Hayes Smartmodem. The 48K memory module was a third party add-on, not Atari's.

It was written in Atari BASIC with a few bytes of machine language thrown in.

o ATKeep -- An Atari 8-bit version of CITADEL BBS, by Brent Barrett
ATKeep is a Citadel-like BBS system for eight-bit Ataris. ATKeep runs under SpartaDOS and requires BASIC XE and 128K of RAM. Originally "MBBBS (Message Base Bulletin Board System) 1.0, March 24th, 1986" MBBBS was changed to Atari Keep, or, ATKeep for short, around version the time version 4.0 was released (June 15, 1986).

ATKeep 7.0 finally took the aide and cosysop commands out of a menu section and put them into extended commands, where they belonged. It also added a SYSOP level command set. Users were no longer "users" "aides" or "cosysops," they had become level "A" (SYSOP) through level "Z" (READ ONLY). The system

had become extremely complex. Public, hidden OR password protected PRIVATE rooms. Each room now had its own access level (thus keeping people of lower level from getting in EVEN if they knew the room name). Each room was assigned a RWRT (or Read WRiTe status), which determined who could enter messages in it, and whether or not public or private messages, or both were to be allowed.

Before version 7.0, ATKeep only worked with the Atari 1030 or XM301 modems. ATKeep 7.0 was rewritten to accomodate the 850 or PRC interface allowing use of any Hayes compatible modem.

ATKeep version 7.50 was released (1987), was version 8 released?

o BBCS -- Bulletin Board Construction Set, by Scott Brause/Antic, 1985
A machine language program, developed as the Jersey Atari Computer Group (JACG) BBS system.

BBCS was known for it's great flexibility. The sysop was offered easy customization by the use of menus. Many BBSes before it required that you had to actually change the BASIC code in order to customize your BBS.

Unfortunately, it also suffered from a reputation for stability problems.

o BBS Express! -- 1986, Leith Ledbetter/Orion Micro Systems
Written in compiled Action!. 1030/XM301 and 850 versions.

o BBS Express! Professional ("Pro!")--6.0b 1999, Lance Ringquist/Video 61
Originally by Keith Ledbetter/Orion Micro Systems.
See also http://cth.dtdns.net/pro/pro1.html

Written in 100% machine language.

Requires XL/XE, SpartaDOS 3.2+, hard drive highly recommended, or at least a large ramdisk. R-Time 8 is fully supported.

o Carina II BBS -- v2.7 (1995), David Hunt/Shadow Software
Carina II was originally developed by Jerry Horanoff.

Requires an XL or XE computer, at least 500K of storage capacity (including ramdisk and drives), and SpartaDOS version 2.3 or greater.
Recommended: 192K ramdisk or greater, and an R-Time cartridge.
Fully supported: An MIO interface and a hard drive.

More Carina II information and links:
http://jybolac.virtualave.net/carina/

Pete Davis writes (15 Aug 2002):
Carina was a pretty powerful BBS system. Though it was written in BASIC (with a number of machine language routines), it was expandable and had was able to load new BASIC programs with the BBS running. In fact, it was quite modular and would load different sections of the BBS at runtime. I actually used it when I ran a BBS some time back.

o Carnival BBS -- essentially AMIS with an overlay to allow for private messages and passwords.

o FoReM BBS -- Friends of Rickey Moose BBS. By Matt Singer.
At the time, there were a lot of BBSs around called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed in BASIC and was somewhat crashy. I think that this is the great-grandparent of the FOREM-XE BBSs that survive today.

Matt Singer writes:
FoReM BBS derived from an early AMIS. When multiple message areas were added the name was extended to FoReM 26M. Then, When OSS released BASIC XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most of the Assembler routines (where is he now?).

o FoReM XL BBS -- by Matt Singer.
FoReM BBS updated to take advantage of BASIC XL from OSS.

o FoReM XE BBS -- by Matt Singer
This version of FOREM BBS requires the commercial BASIC XE cartridge in order to run. It is in the public domain and can import and export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only, control ATASCII graphics are reserved for message data-structure bytes).

o FoReM XE Professional BBS / FoReM XEP BBS -- by Len Spencer
A re-write of FoReM XE BBS, last version was 5.4, Jan 5 1993.
FXEP requires an XL/XE computer with at least 128k of memory, the BASIC XE cartridge from OSS/ICD, SpartaDOS 3.2 (this program will NOT work with any other version), and at least 500K of storage.

FXEP is in the public domain, http://members.aol.com/lenspencer/

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston, Massachusetts, USA, area.

"1983: Nite-Lite B.B.S. goes on the air. (Was it running A.M.I.S. ?) It is called "Nite-Lite" because the computer monitor casts an eerie glow about the room. 1984: Paul Swanson writes his own BBS hosting software for the ATARI 6502 8-bit computer. He names it "Nite-Lite". The Nite-Lite BBS hosting software goes on to be the most successful commercial BBS software ever written for the ATARI 6502 8-bit computer. 1989: Nite-Lite BBS puts in a second line. (MichTron boards eventually take the place of all of the ATARI Nite-Lite boards.)" - Winston Smith

This BBS was the first to support a RAMdisk, which Paul Swanson called a "V:" device for "virtual disk". This BBS was written in Atari BASIC and required a joystick hardware "dongle" device. This was notable as being one of the first Atari 8-BIT BBSs that could actually go for a week without having to be rebooted. Pointers to the message base were kept in an Atari "very long string" (for which Atari BASIC is famous). The BBS would only have problems (for the most part) if this string became corrupted.

o OASIS (the commercial version) / OASIS Jr. (the pd version)
Originally by Ralph Walden, then Leo Newman took it over, followed by Glenda Stocks/Z INNOVATORS, then Alf (Jeff Williams).

All machine language. OASIS is very crash-resistant and comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". An excellent message system, and a complex file system. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). OASIS IV performs networking.

Glenda Stocks writes at http://world.std.com/~snet/glenda.htm :
I purchased the source code rights to OASIS and began marketing the BBS software to Atari 8-bit enthusiasts around the world. I felt that I had the superior BBS software because I had programmed in the ability to run external programs, including online games and user surveys. I also had added color prompts for IBM clone users who called Atari boards running my OASIS software. Sometime in 1991...I sold the rights to OASIS to a man in Canada..

Jeff Williams ("Alf") writes: (12/6/02)
OASIS was around prior to either PRO or BBS Express IIRC. I don't know when exactly it showed up, version 3.09 was the first one I remember seeing. What made it nifty was it was very fast, being all assembler, and having some different features that things like Forem & Carina didn't have. Compared to something like Forem MPP at the time, it was kind of amazing.

Ralph Walden sold it to Glenda Stocks, who chopped it up into modules and sold it as ver 4.7. PRO was out by then, and was a much more complete offering imo. Glenda wrote some modules for 4.7, but it never really went anywhere because the architecture was so cramped with her changes.

Eventually she gave up and sold me the source. I looked it over and realized it was a mess and nothing was going to happen with it. I worked on a version 5 for a while, but never made much progress.

o SMART BBS -- by Marco Benton.
This program is written entirely in BASIC. It expects to be running under a SpartaDOS environment. This BBS program uses a "modem clock string" rather than an R-Time 8 cartridge in order to retrieve the current time. It also comes with an Atari BASIC game door called "Sabotage".

Subject: 10.3) How can I read/write 8-bit Atari disks on an MS-DOS PC?

There are several programs that allow an MS-DOS system to work with an Atari-format 5.25" diskette. Each of these work with the Atari SS/DD 180K format, so you'll need an Atari DOS and disk drive capable of this format.

#1 Choice:
AtariDsk V1.2 (c) 95-12-09 by HiassofT (Matthias Reichl)
http://www.horus.com/~hias/atari/

#2 Choice:
MyUTIL by Mark K Vallevand. Based on Charles Marslett's UTIL.
http://www.umich.edu/~archive/atari/8bit/Diskutils/Transfer/myutil.zip

Includes SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

Other similar utilities:
ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
www.umich.edu/~archive/atari/8bit/Unverified/Diskutils-redist/atario21.arc
SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
http://www.umich.edu/~archive/atari/8bit/Diskutils/Transfer/sr.arc
UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks.
http://www.wordmark.org/

Here's some advice on using the above utilities from Hans Breitenlohner:

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width.
The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo sums it up this way:
So a basic rule of thumb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of

course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above mentioned utilities work with SS/DD 180K Atari-format disks or
SS/DD 180K SpartaDOS disks, the following combination of utilities has been
used successfully to read SS/SD 90K Atari-format disks. So if you only have
standard Atari 810 and/or Atari 1050 drives, you could look into:

AnaDisk -- now a product of New Technoligies Inc. (NTI)
See: http://www.forensics-intl.com/anadisk.html
The current version is "not made available to the general public" (!)
Previously a product of Chuck Guzis @ Sydex, http://www.sydex.com/
Older versions available: http://ch.twi.tudelft.nl/~sidney/atari/
- Reads/Writes "any" 5.25" diskette

DeAna by Nate Monson
Available: http://ch.twi.tudelft.nl/~sidney/atari/
- converts AnaDisk dump files from Atari format

See http://ch.twi.tudelft.nl/~sidney/atari/ for tips on using this
combination of utilities.

Preston Crow writes:
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.

For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 10.4) How can I read/write MS-DOS PC disks on my Atari?

Several 3rd-party hardware upgrades add the capability of working with
MS-DOS diskettes to your Atari system:

Happy 1050 upgrade for the Atari 1050
-- read/write 180K 5.25" MS-DOS floppies

CSS XF Single Drive Upgrade for the Atari XF551
-- replace the 5.25" mechanism with a 3.5" mech.
-- read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFsingdrup.htm

CSS XF Dual Drive Upgrade for the Atari XF551
-- add 3.5" drive without losing the 5.25" drive
-- read 720K 3.5" MS-DOS disks
see http://www.nleaudio.com/css/products/XFdualdrup.htm

CSS Floppy Board, for the CSS Black Box
-- adds support for PC 720K and 1.44MB 3.5" drives to your Atari system
-- adds support for PC 1.2MB and 360K 5.25" drives to your Atari system
-- read/write 5.25" and 3.5" MS-DOS disks in your PC drives with your Atari
see: http://www.nleaudio.com/css/products/floppy.htm

Subject: 10.5) How do I transfer files using a null modem cable?

This section by Russ Gilbert.

Q: How do I connect two computers using a null modem cable?

A: You need a term program and RS 232 ports on both
computers. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25 pin
port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin
#3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes
to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'
side, 12 holes on the 'short' side. The numbers go
to the left 1 to 13 then #14 is under #1 and left again
so that #25 is under #13.

Most term programs allow a null connection, without a
carrier detect. Notably, '850 Express!' does not. I have
only used 'Procomm 2.4.3' (the last shareware version of
Procomm) on the PC and BobTerm on the Atari, but other
term programs may work.

To check your null modem connection, start both PC and
Atari term programs, set baud to 2400 or 4800 on both
computers. No parity, 8 data bits, 1 stop bit on the PC.
Be sure to use the correct COM port on the PC. Go to
'terminal' mode and you should now be able to type on
either computer and see it on the other screen. To
accomplish a file transfer, use Y-modem probably from
BobTerm, rather than X-modem. X-modem will often append
bytes to a file transfer, an undesirable event. There is
also a very nice Z-modem recieve program for the Atari,
called ATAR-Z-MODEM by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about
30 feet long, is to use two female DB25 connectors
(Radio Shack) some three or more conductor cable. Using
the two DB25 female connectors allows unplugging your

modems and plugging in the null modem cable into the two modem cables. This also avoids the confusion of variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: Connection, MIO, Black Box or similar device that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you need the flow control lines and Atari term software that has flow control built in. You also need an MIO or Black Box, which uses the PBI (parallel bus). A high speed cable would need not only XMT, RCV, and GND, but also flow control lines. I suggest a commercial null modem from computer store to ensure correct lines. A null modem is a small adapter with the correct lines already crossed. I don't know how to correctly connect the CTS, RTS, DTR, DSR, CRX lines for a high speed null modem. With a null modem, you just plug it into the 25 pin connectors of the two modem cables you might already have connected to your Atari and PC or Mac. You may need a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here: (Figure out or look for pin numbers on the ports.) Note that these are pin assignments, and NOT null modem connections with the XMT, RCV crossed and GND straight thru.

Atari 8-bit PC AT 25 PC AT 9 pin
---
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3
4. RCV 3 2*
5. GND 7 5
6. DSR 6 6

7. RTS 4 7
8. CTS 5 8
9. No connect? shield RI
22 RI

Note: * above indicates the difference between an AT 9 pin
and a Atari 8-bit 9 pin cable connector. eg. If you check
continuity from pin 3 of 25 pin end and it goes to pin
4 of nine pin end, you have an Atari serial cable. If pin
3 of 25 pin goes to pin 2 of 9 pin end, you have a PC
serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

Subject: 10.6) How can my Atari use my PC's HD using SIO2PC or Atari810?

SIO2PC
======
From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC
compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari
programs could be stored on the PC's hard (or floppy) drives. It turned out to
be quite successful. About 95% of my work was in the software, but a hardware
device to convert logic levels was also necessary. This device is now commonly
referred to as an SIO2PC cable.

Features:
- Emulates 1 to 4 Atari disk drives
- Store your Atari files on PC hard or floppy drives
- Boot from the PC, real drive not needed to start-up
- No software or drivers required for the Atari;
no conflicts: use your favorite DOS
- Twice as fast as an Atari 810 drive and more reliable
- Co-exists with real drives in the Atari daisy chain
- Compatible down to the hardware level: use sector copiers, etc.
- Print-Thru captures Atari print-out and routes to PC's printer
- Convert Atari files to PC files and vice versa
- 1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy
http://www.cswnet.com/~nkennedy/

Another source for building SIO2PC cables is Clarence Dyson's page at
http://www.geocities.com/atarimods/atari.html

Atari810
========

Atari810 1.4d, by Dan Vernon, is a disk drive emulator in the tradition of SIO2PC, for the Windows NT/2000/XP platform
http://retrobits.net/

Subject: 10.7) How can my Atari use my PC's HD, printer and modem using APE?

David A. Paterson writes:

"Steven J. Tucker took SIO2PC one better and wrote new software.
The Atari Peripheral Emulator (APE for short):

- lets your PC act as high-speed drives.
- It lets you print to your PC printer.
- And it lets you use your PC modem on the 8-bit."

http://www.atarimax.com/

Subject: 10.8) How can I connect my 1050 to my PC with the APE ProSystem?

The APE ProSystem goes beyond APE. The ProSystem has two components:

- The program PROSYS.EXE is used to create the protected and unprotected disk images which are then used by APE.

- The ProSystem hardware is a cable designed to allow direct connection of a stock 1050 disk drive directly to a PC's serial port for use by the PROSYS.EXE software.

http://www.atarimax.com/

Subject: 10.9) What about interoperating with the Apple Macintosh?

Mark L. Simonson keeps a nice set of web pages which he calls "Mac/Atari Fusion: Atari 8-bit Resources for Mac Users." Please visit:

http://www2.bitstream.net/~marksim/atarimac/

Subject: 10.10) Are there 8-bit Atari tools for the Commodore Amiga?

'551conv', freeware by Achim Hartel:
Converts a real Atari-800-disk, .xfd-image or .atr-image into a real Atari-800-disk, .xfd-image, .atr-image or extracts the files of the disk (-image). All 4 formats of the XF551-station supported: Single, Medium, Double, Quad. Version 1.03.

Subject: 11.1) How did Atari get its name?

Graham Thornton types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are theirs, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong.

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 11.2) What is the History of Atari?

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari, Incorporated is formed by Nolan Bushnell, incorporated on Tuesday, June 27.

Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari, Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor.

1979
Atari files with the USPTO for a patent for a "Data processing system with programmable graphics generator" (the 400/800 computer system) on January 8, 1979. Inventors listed:
Mayer, Steven T. (Auburn, CA);
Miner, Jay G. (Sunnyvale, CA);
Neubauer, Douglas G. (Santa Clara, CA);
Decuir, Joseph C. (Mountain View, CA)

The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand-built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirement had been met.

The first "real" consumer units were shipped in Nov. of '79 and were 400s to Sears followed very shortly by 800s."

All Atari computers are tested at the factory by a master computer called the Atari Sentinel System.

1981
From Atari Connection magazine:
"At the National Computer Conference in Chicago on May 5, 1981 Atari announced that the 8K Atari 400 was being discontinued and that the price on the 16K version was being reduced to $399."

The USPTO grants U.S. Patent 4,296,476 to Atari on October 20, 1981 for the 400/800 computer system. Read the full text of the patent here: http://makeashorterlink.com/?M2561456

November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL.

1984
Atari is split 3 ways: 1) Atari Corp 2) Atari Games Corp 3) Luma Telecom

Warner Communications sells the Consumer Electronics and Home Computer divisions of the former Atari, Inc. to Tramel Technology on Monday, July 2.

Tramel Technology immediately forms Atari Corporation. Atari Corp. inherits Atari copyrights/trademarks/patents for use in the consumer electronics and personal computing markets.

{ Warner sells the AtariTel division of the former Atari, Inc. to Mitsubishi Electric, and the former AtariTel becomes Luma Telecom.

A complete line of "cutting-edge" telecommunications products had been under development at AtariTel since 1981, but no products had been

released under Atari, Inc.

However, the Atari Videophone was nearly completed, and the product eventually surfaced as the Mitsubishi Luma Video Phone, aka Luma-Phone, aka LumaPhone. "The Visual Telephone"

Mitsubishi has since shut down Luma (date unknown).
}
(
Warner also initially retains the arcade division of the former Atari, Inc., and renames it Atari Games Corporation. Soon thereafter, Atari Games is a private, independent entity, though Warner remains a major investor.

Atari Games Corp. inherits Atari copyrights/trademarks/patents for use in the coin-operated arcade video game market.

1987
Atari Games creates the Tengen label for the purpose of marketing games for home game systems (potentially competing directly with Atari Corp.)

1993
Atari Games is (re-)purchased by Time Warner.

1994
Time Warner consolidates Atari Games into Time Warner Interactive. Use of both the Atari Games and the Tengen brands are discontinued.

1996
On March 29, 1996 WMS Industries (Williams, Bally and Midway) completes its purchase of Time Warner Interactive. Upon the sale, Time Warner Interactive adopts the Atari Games name and logo, and Atari Games is made a division of Midway Games.

1998
In April of 1998 WMS spins off to shareholders its entire stake of Midway Games, making Midway Games essentially an independent entity. Atari Games remains a division of Midway Games.

1999
Atari Games releases San Francisco Rush 2049. This turns out to be the last coin-operated arcade game sporting the Atari Games name and logo.

January 2000: Atari Games is renamed Midway Games West, and games produced by the group will sport the Midway Games brand.

June 22, 2001: Midway Games announces it is exiting the coin-operated arcade video game market; its game development efforts will now be focused on games for home game platforms. The Midway Games West division lives on, developing games for home systems for Midway Games.

February 7, 2003: Midway Games shuts down their Midway Games West division.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system.

1992
Atari (U.S.) officially dropped all remaining support of their 8-bit computer line on January 1, 1992. (Some 800XE's were still being manufactured in China in 1992.)

1996
On July 31, 1996, in a "reverse merger," Atari Corp. purchased JTS, with the new parent company taking the JTS name while Atari was immediately designated a JTS subsidiary.

(JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.)

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which was a subsidiary of Hasbro, Inc., for $5 million in cash.

(JTS filed for Chapter 11 Bankruptcy Protection on December 11, 1998, and then converted it to Chapter 7 on February 28, 1999)

Hasbro Interactive produced games for several platforms, including PCs running MS-Windows. Some of Hasbro Interactive's games, including several re-makes of classic Atari titles, were marketed under the Atari Interactive name and logo. Atari Interactive was termed "a Hasbro Affiliate."

Games produced by "Atari" under Hasbro ownership included:
Atari Arcade Hits 1 & 2, Breakout, Centipede, Missile Command,
Nerf ArenaBlast, Pong, Q*Bert, The Next Tetris, Atari Greatest Hits

2001
On January 29, 2001 Infogrames Entertainment announced completion of its acquisition of Hasbro Interactive from Hasbro, renaming the subsidiary "Infogrames Interactive." The purchase included the Atari titles and intellectual properties (known at Hasbro as "Atari Interactive").

Between 2001 and 2003 Infogrames placed the Atari brand on some of its "premiere" gaming titles.

2003
Beginning May 7, 2003 Infogrames Entertainment adopts the Atari brand and registered trademark for all operations, effectively changing the name of the entire company to Atari.

Additionally, the Company's wholly-owned subsidiary, Infogrames Interactive, Inc., which develops many of the game derived from the Hasbro line of board

games, changes its name to Atari Interactive, Inc.

TODAY = http://www.atari.com/

Infogrames Entertainment
========================
Founded in 1983 by Bruno Bonnell and Christophe Sapet, Infogrames Entertainment SA today has more than 1,800 employees worldwide (approximately 60% in Europe and 40% in the U.S.). A publicly traded company, Infogrames Entertainment SA (Euronext: 5257) is one of the top five publishers of interactive entertainment software in the world and is widely regarded for developing and distributing quality games for the mass entertainment audience.

Infogrames SA comprises two main subsidiaries: 1) the U.S. based, publicly traded Atari, Inc. (Nasdaq: ATAR); and 2) Atari Europe, which represents the Company's original operations. Atari, Inc. includes the former GT Interactive; Atari, Inc. also manages Atari Interactive, Inc. (the former Hasbro Interactive) on behalf of its parent company.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Larry

When I get more issues on-line you'll be able to do this with the search function on the front page of the Page 6 site. In the meantime, if you are looking for something in particular then drop me an email and I'll see if I can find it!

Regards
Paul

It's an interesting webshop, bright and welcoming and pretty easy to
navigate. Are you a professional dealer with years of webshop
experience, or are you a "regular joe" who purchased some webshop kit?

Date: 2004-08-30 20:03:45 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1093896305.20786.0@iris.uk.clara.net>
Source record: 14702

Hello All,

As promised, the DGS PD Library PC CD-ROM is now available. It is being offered at an introductory price of just $6 including shipping (surface mail - airmail optional for $1.50 extra). Our commercial CD-ROM is also available at the same price. The two are available together as a combo (on one CD) at $8.50 inc. shipping ($10 for airmail). UK buyers have the option of paying in pounds.

You can buy now with a Credit/Debit/Charge card (through PayPal).

Please go to our website at http://www.dgs.clara.net and follow the link.

Shipping will be carried out in batches starting Weds/Thurs of this week.

Dean Garraghty

3046. Printer cables

Newsgroup: comp.sys.atari.8bit

Howdy folks

A local store (Media Markt) is selling old fashioned printer cables (no screws, bit I guess they are "clicked" together.)

10 Euro cents for the ones that are 1.80 meters (just under 6 foot) and 20 euro cents for the ones that are 3.00 meters (just under 10 foot). They way close to (but just over I guess) 250 gramms. Anybody interested? BTW, I'm not gonna check every one of them. I bought 2 of them 3.00 meter long ones. Haven't tested them yet.

I wonder if you can help me out'
I just bought a CD on Ebay with 30 Atari games for PC. My problem is
that my computers are either Win XP or 2000 and I can't run the CD on
them. I'd get the initial introductory screen that says Part I and
Part 2 and then it freezes, nothing happens.
How can i get to run this CD on either XP or 2000
Thanks
Yoseph

30 Atari games for PC? If these are really Atari PC games, then they are
commercial Hasbro or Infogrames programs. I don't think your problem is XP
or 2000, the disk must be bad, a bad copy. Try reading it on someone else's
computer, with Win ME or 98SE. Could be your CD is flaky.

3051. Re: Question about Atari games CD

I've often debated this with people as I am in the IT field. I have NEVER NEVER EVER seen a 'bad' cd from a commercial press. I've seen bad cd burns, but not pressed copies. I have, however, had problem with certain types of cd-rom drives. Not saying it isn't possible, but that has been my experience.

I think it's pretty greedy to sell the manual seperately. I mean, for that
asking price it should be inclusive, IMO.

FWIW, the figure that I have heard/read through the years is that the number actually produced was in the mid-200's.

I think I'd bid on it, but then my car wouldn't go in the garage. ;-)

That is disgusting. I'm sorry, I had one woman I dated make me miss the marriage of some good BBS friends of mine. Forever regretted missing that. Any woman that would make you get rid of something that you love is truthfully not worth it at least in my book.

The way I see it is this... she liked you. What comprised you? Your experiences right? What were part of those experiences? The Atari! Pur life is a tapestry. Pull on one thread and it unravels it all.

Woman and sex vs. my Atari and other toys? Sorry, never met a woman that was THAT worth it. :)

Doctor Clu

I wish I could remember exactly what Bill Wilkinson said. Something like there was an in house drive developed ~1979 that Atari never got to work right and the 810 was actually developed by Tandon.

Now here is where it gets real foggy. I think the in house engineers may have been responsible for developing the 815 using Tandon's 810 design to work from. Meanwhile Tandon was developing the 1050. By the time the 815 was ready it would have to sell for some insanely high price in the $900 range. There was an initial small production run of 815s and 815s were sent to all the software developers i.e. EA, OSS.

Tandon was working on the 1050 and finished it before the real production run of 815s was made. The price of the 1050 was going to be ~$200 so it didn't make sense to market an 815 dual SSDD drive for $900 when you could have more storage for less money buying a bunch of 1050s.

Side notes: In my days of scrounging computer stuff I found a stack of official "Atari 815tm Master Diskette" label disks in a bin. I booted it on a USD 1050 and IIRC it supported double density. I think I sent an ATR or something to a collector in Australia. I'm not sure if it is found in any archives. My disk, like everything else in my computer collection, has received the girlfriend "I am going to get rid of this crap" treatment. To illustrate the problem, I took apart my cap and ball Remington .44 replica piston to reblue and she threw it away. If it

ain't scraps of cloth or burnt out candles, it is junk that must be tossed.<sic>

I remember 1050 drives going for $449.00 when they first came out. Later
the price dropped to $179.00, that's when I got my first disk drive.

I saw the drive long ago at a friends house, so it was released to the
public at some point.

The $600 asking price is frigging ridiculous. It's not that
rare/special/valuable, etc. Probably explains why there are 0 bids
on it.

3065. Looking for another key for the Atari 800 "1" key

I remember seeing at least one at a local computer store in Connecticut circa 80-82 (exact year a bit fuzzy). They were released to the public and they were expensive. I believe there were at least one third party dual drive as well.

Here's some jokes I racked from my brain... oh it hurts

Jokes... as in nothing personal only in gest

And remember joke's are simply observations of life/life observations
that are transcribed/translated into a humourous verse/verses

---

They say that Hitler only had one ball, the other was
used in the 1966 world cup final

The Swedes came up with Ikea, and Sven ï¿½the man' Ericcson came
up with Sex with instructions

Another rooney momentï¿½ man utd have just bought the
first footballer who prefers to ply his trade at
nightï¿½. One on one and all that

Man Utd dresseing room (15 minutes before kick off)
Ferguson (in his dapper jock accent) where the effing
hell is rooneyï¿½ 5 hrs. later (in the seedier side of
Manchester) huh. huh. Huh, yes, yes, yesï¿½. I've
scoredï¿½ one nil to Man Uï¿½ Christ and your get paid
28million for that, fu!@# me, I've had better shag's
and one night stand's with a motionless lamp post

Wayne Rooney's first Man U. goal was disallowedï¿½
because he played well offside (wellï¿½it was with one
of his team mates)

If Galileo was alive to today, and working as a
journalist, here's a summary of 2 questions he would
have asked Neil Armstrong

So, Neil did you see the man in the moon then

And what kind of cheese is the moon made of

Rebecca Loos on Victoria Beckham.. I've had more txts
with DB then Victoria will have babies

Is there a mobile phone version of ï¿½sexually
transmitted diseases', I only ask because the concept
of ï¿½phone sex' has now transplanted itself to mobile
phones (according to figures launched by Assn. of
Mobile Phone Manuf's.)

Wayne Rooney to his ï¿½girlfriend'ï¿½ I've had more txt's than you've had hot dinnersï¿½. Ahh., so he's figured out how to use a mobile phone and send a text messageï¿½. That's a milestone even for a footballer, let alone wayne rooney

Ferguson on Rooney, ï¿½so wayneï¿½ what position suits you best, the left side or the right side, up or down, in or out'ï¿½ and rooney saysï¿½ nah this just seems too difficultï¿½ I think I'll start with foreplay and we'll go from there

George ï¿½Dubya' Bush and George best has just release a reworked duet version of the classic Police single, this version is called ï¿½Living in a bottle?'

Victoria Beckham has been voted ï¿½employee of the year' in the Tesco's Baby care dept.. her slogan/strapline? Was "1 have 3 caesarians for the price of 1, 3 caesarians for the price of 1, come on any takers, 3 caesarians for the price of 1ï¿½ best value ever"

Whats the difference between Faria Alam and a Prostitute
A Prostitute is more careful who she/he get's paid by

What's the difference between Faria Alam and a Prostitute
A prostitute doesn't have a reputation that needs repairing/salvaging

What's the Difference between the politician and a prostitute?
A politician gets paid for asking questions
A prostitute get paid by asking for sex

What do you get if you cross a politician with a prostitute?
Someone that asks questions for sex or Sex for Questions

What do you get if you cross a politician with a prostitute?
Someone that asks for sexual questions in parliament
Or
Someone that asks sexual questions in parliament

Heard in the Sharapova/Williams Wimbledon finalï¿½.. New balls please, love all, forty. love, game.. Sex and match Ms Sharapova

(Driving instructor to a learner driver- on the M25) I wonder how far round the M25 our friend Mr. Schumacher will get in his nice new Ferrari F1 car

Little Boy to his daddyï¿½ Daddy, the man on the
telly said that the M25 is the worlds largest car
parkï¿½ so why do we in London need all the multi storey
car parks for, why don't they go and park on the M25

Who the best known prostitute's pimp in the UK
Max Clifford

(Arsene Wenger on entering Highbury for the first
time), so Arsene, what Football team do YOU supportï¿½
after a short pause and in classic Gallic English,
well I dunno, em, I guess I support my legs, my legs
support me

(Mark Palios on Leaving Soho Sq. for the Last time)
Well I support football and football supports me

George ï¿½Dubya' Bushï¿½. America's First elected
Rat-arsed and well-plastered president (who still
believes-along with our Tony, that Iraq has WMD
capability), and he's got his smudging great big
thumb, on that little red button that means ï¿½oh so
much' (Georgeï¿½ come out of the bottle)

(George ï¿½Dubya' Bush at one of those American
Political caucuses)ï¿½ in his American/Texan droolï¿½ I've
had a Epiphany (George I didn't know you understood
such advanced concepts) I have a commandment given to
me by the Lord Jesus Christ Himselfï¿½ And it's saysï¿½. I
support God ï¿½.and GOD supports me, and everything I do
in the name of the presidency of the United States of
Americaï¿½ so help me GOD

According to the Major UK political think tanks, they
say that Politicians view Accountants as the new
bankers
So it begs the questionï¿½ what do we need the sodding
bankers for in the first place

I understand the common attitude towards politicians
(both in the US and UK) is one ofï¿½ politician's are in
the pockets of the businesses and the businesses are
in the pockets of the politicians
So again it begs the question, with everyone's hands
in everyone else's trouser pocketsï¿½ who's looking
after the money (and also ï¿½. Oi Stop playing with
yourselves)

ï¿½.. Customer in a music shopï¿½..If any of the winners
of x factor, pop idol, the rivals and fame academy (1
& 2) can sing, then I want my money back

Simon Cowell apparently has written into his contract
that if Victoria Beckham enters the audition then ITV

must refund all advertisers their money back, and send all the viewers (about 2) a voucher towards their next TV license renewal

Victoria Beckhamï¿½. Official spokesperson for the society of stick insects

Breaking news from the Beebï¿½ The BBC has broken with tradition and allowed paid for advertising on it's premier stationï¿½ the first advert will be promoting Parkinson's new ITV chat show series

Der Der Der Der Der Der Der Derï¿½ so footballers can sing then, who were they coached byï¿½. Victoria Beckham

Sergeant Major to a static lamp postï¿½.. Atenï¿½ Shun

Little child (in some town UK) after seeing Matthew Pinsent loose a rowing raceï¿½. Mummy do boats have wheels, because the voice on the telly said that ï¿½the wheels have truly fallen off, for this once great UK rowing team'

Matthew Pinsent's first words (according to mother) was ï¿½row, row, row your boatï¿½..'

People in the Army (or armed forces) are the least numerate (here's an example) up. Two, three, four, up, two three, four.. etc. etc (that's better then Ted Rogers, he can only count from 3)

(Little girl to her motherï¿½.) Mummy why do people on the telly only count to or from three, don't they know the other numbers yet

Scientists have now discovered how to make multi cell brains. Increasing storage levels/brain cap. Exponentially, however they said the compatibility with their test subjectsï¿½ American's ï¿½will be the greatest challenge

Intel (some big shot Yankee co.) has just developed a world first, the first multi-chip computer, the US govt. has put in a bulk order so that all Americans can interface this device with their single cell brain

Advert/Promotion as seem on American poster Cokeï¿½ Gives you the ï¿½get up and go'ï¿½ everydayï¿½.. But there again, so does cocaine, coffee and certain other things I wont mention (do you really need me to go on)

Did you hear about the family from Ohio who were going to book their first ever holiday

Well they tried to book it through McDonald's, and they weren't exactly happy when they were told ï¿½sorry folks we only do fast food', now will that be big Mac with fries or withoutï¿½ and do you want a shake with that

McDonald's have just won the pitch to become the official sponsor and official food/food supplement for ï¿½The Cambridge Diet'

UK Medical scientist's have come up with a new name for stomach bugs and heart attacksï¿½ they call it ï¿½having a McDonalds are we'

(Little American Girl to her mommy) Mommy Mommy, I wanna be a Hollywood starï¿½. There, there little one, there's daddies little colt .45, why don't yah go out over there and go play with it

They say that the American's were first to the moon, it's a shame that didn't have or bring a map with them (or was it signpostedï¿½ you know, THIS IS THE MOONï¿½ LAND HERE)

Is it true that the American Billion(aire) is worth less then the British/English Billion(aire)ï¿½ now I know why the guy behind Ikea is now the world's richest person

An easy way to test an American's intelligence/brain capacityï¿½ ask them to count up to ten (without assistance)ï¿½. One, twoï¿½ err! What comes after two?

This is a FINAL warning to all Briton's visiting America, if you ever get into a relationship with an American, make sure that they know how to use their vitals, as American's don't come with instructionsï¿½ it's a case of plug in and play

Did you hear about the American tourist trying to find the Eros statue (In Manchester?)

UK Athletics have won the national lottery, your prize.. a free all expenses paid trip to Athens to see the Olympics (just don't go to any local chemist's/pharmacies)

What did the left ear say to the right earï¿½ You're hearing things
What did the right eye say to the left eyeï¿½ you're seeing things?
What did the left nostril say to the right nostrilï¿½ phoar!!! Can you smell that?

Dwayne Chambers and Ben Johnson form a strategic partnership, their first targeti¿½ boot's the chemist

Lastlyi¿½ After all these investigations, the Greek athlete Kanterisi¿½ has apparently be done by local police for driving under the influence (DUI)

Wayne Rooney's next move will probably be Ajax (in Amsterdam)

They say that the American's invented the single chip computer, this was so that they could interface it with their single cell brains

One American to Anotheri¿½ Now where DID I leave my thinking cap (or even better) Now where DID I leave THAT thinking cap

What's the difference between the ave. American and plankton

Well Plankton is the lowest level/life form in the food chain, and it could be proved that American's don't have much happening/much activity between their ears

What happened when Tony Blair and George i¿½Dubya' Bush, knocked heads togetheri¿½
Sawdust was seen coming out of one or both of George Bush's ears

Scientists and paleontologists have just made a new discovery, the first life form with a single cell brain since the dinosaur extinction, and a close relation to PLANKTON, the scientists and paleontologists have jointly agreed on a name for this new life formi¿½. Americans

Americans and Planktoni¿½.. Compatible bedfellows?

What's the definition of the m25i¿½ the world's largest free mobile car park

Londoner's don't need F1 racing coming to them; London's already got the North Circular, the South Circular road and The M25

Another definition of the m25i¿½ F1 racing in slow motioni¿½ for would be drivers

Little boy (somewhere in London) speaking to daddyi¿½. Daddy the voice on the telly said that the M25 is the biggest car park in the worldi¿½.. So why are they building a multi story car park down the road

What's the difference between the M25 and a Multi storey car park?

Well one is a paid for service, and you still get your car broke into/relieved of your car
And the other one is a free service, and you still keep your car (and it's contents)

I was told the speed of London's traffic is such, that it's almost comparable to an F1 driver taking a circuit around Silverstone, Hockenheim etc, if this is so all that we're missing is the pavement/roadside advertising

Hey,,, the speed of London traffic has increased that muchï¿½ that If I start my training now, in twenty years time, I'll have beaten Schumacher to pole by .01 of a second

Another rooney momentï¿½ Ron Manager hereï¿½.. Wayne Rooney, what a lad, what a goerï¿½. Is he a Merchant banker or a Barclays' banker

Victoria Beckham's got talent (can she sing?) DB has got brains and Skill (can he play football?) and the tip of my fingernail on my baby finger is Robbie Williams (do I need to go on)

How do you spot an American Tourist.... they're the one's carry a London A-Z whilst visting Manchester

How do you spot a Japanese tourist.... They're the ones with sony, nikon, jvc, panasonic or hitachi hanging somwhere on their person

How do you spot a french tourist... They're the one's usually throwing up outside eateries or eating est. that don't sell french food (a'la mc donolds etc...)

How to spot an American tourist (No.2).... They think that the UK begins and Ends at a Mc Donolds (or some other similarly fashioned establishment)

What does the typical American think of Fish and Chips.... Fast food for ethiopians, sudanese..etc.etc

How do you spot a spanish tourist.... they're the ones usualy packing out the Cruff's dog show (or similarly fashion events)

What does the typical american think of british pancakes..... Bread rations for ethiopians, sudanese..etc.etc

What's the definition of 'stick insect' with boobs..... Victoria Beckham in a weight gain programme

He shoot's He scores.... Another rooney one night stand (gone wrong)

Heard the latest... Victoria Beckham's just entered an ITV remake of fame academy, word is the PA to Mr Cowell said... 'don't call us... we'll call you'

Faria Alam has just being named sainsbury's marketing genius of the year, with her slogan "I've got 2 shags for the price of one"

After 'scoring' with Mark Palios and Sven goran Ericcson, Faria was heard to say 'that 'll be 750.000 pounds please', and that's just so that i can salvage/repair my reputation... as a prostitute (I don't know if they paid up)

How to spot an italian tourist... They're usualy the ones frequenting the more sullied parts of kings cross and soho

Notice to Americans visiting london, London bridge is static, tower bridge is the one that goes up and down

I heard that seats, chairs and stools speak, when someone said... stop talking out of that thing you're sitting on

Suppositories and enema's, oral medicine for people that talk Sh!@$%

Big Daddy... F Plan diet's spokesperson of the year

Giant Haystacks.... Weight Watchers everywhere beware (you can end up like this)

Robbie Williams (I'm rich, I'm rich beyond my wildest dreams), I.m dreaming that I'm talented, I can sing and I look bloody awfull

Victoria Beckham... 'wants' to sign for Man U, talentless, brainless and trying for a hatrick (sound's like a future DB)

Now I know why rooney signed for man u, so he can play away ..play away, away, way, play away, away, way, play away

Michael Owen gone to join real madrid... so he can learn to play football

daddy, if the wheels on the bus goes round and round, what does the bus with square wheels do

Jamie Oliver a well know chef, it's a case ofï¿½. Can't cook don't cook, don't cook, wont cook or wont cook, can't cookï¿½ to save his life

Victoria Beckham on cookingï¿½.. David, I've got to keep my figure you knowï¿½ eat something womanï¿½ eat

Not so much a jokeï¿½ more of an observationï¿½ We gave the world the ï¿½beautiful' game of football (with the help of the ancient Chinese)ï¿½ now we have the Brazilians, with technical assistance supplied by the GERMANS teaching the world how to play the gameï¿½. If that wasn't enough We still lose to teams like the USA and Australia, and we still loose on penalties (thanks to a certain Swiss referee.. with a cuckoo mentality)

Another observation hereï¿½has anyone ever been to Westferry road (docklands/canary wharf etc) where is comes to Marsh Wallï¿½All I can say is ï¿½Traffic Lighted up like a Christmas tree' ï¿½ traffic light heaven' ï¿½the car drivers/motorists hell'

Another observationï¿½ and one for you computer geeks All the following have something in common

Ralph Baer and Nolan Bushnell (Videogames)
Alan Kay and Marcian ï¿½Ted' Hoff (computers/ operating systems)

The thing that connects these guys's is that they were all ï¿½one hit wonders', in that they promised lots, but delivered very little if anythingï¿½. Which is comparable to?
ï¿½a lot of very hot air and not an ounce of substance to show for their actions?'

There is (from what I'm told) a tenuous ï¿½Atari' connectionï¿½ but for the purposes of this email/post I'll leave it for another day

Atariï¿½. A Former American company that thinks it's Japanese

Segaï¿½. A former American company that's owned by the Japanese

Microsoftï¿½ they didn't want anything to do with whatever Atari were doing, producing, manufacturing ,selling and most importantly didn't want to get involved in any industry that Atari were responsible for creating or selling into or involved with Question is Microsoft.. What the F!@# is an Xbox (der.. a game system, just like the Atari wasn't it)

Even worse (or should that be "it gets' better") at the so-called world ï¿½launch' of the Xbox, Gates

himself is caught on camera and is quoted directly as
ï¿½paying homage to Atari'

Is Microsoft the New Atari?

Is Atari (infogrammes) the new Microsoft?

Is Gates suffering delusions of madness? (Next US
President)

Contradiction is the first sign of incompetence

And finally a last observationï¿½. And a very important
one...and before I get irate Americans emailing me, it's nothing
personal... as it say's, just an observation

What is it about the American mentality that they
like/need to ï¿½bastardize' everything, they bastardized
the accounting system we gave the world, the
bastardized the legal we gave the world, they've
bastardized Christianity, alienated Muslims everywhere
(speaking as a non Muslim) , they've even gone as far
as to bastardize the ï¿½beautiful' games of Football and
Rugby, and now the final insultï¿½. They've cannibalized
and corrupted the English language, that the
British/English gave the worldï¿½. Is there anything the
American's haven't bastardized?

Weï¿½ As in The English/British

Following on from the bastardization theme, applying
that to inventions and discoveries
Americans invented the internet (the British invented
the technology/infrastructure behind it)
The Americans broke the sound barrier in aircraft (the
British invented and supplied the technology that
allowed the Americans to claim this feat)
The American's invented the light bulb (stolen from an
original British design)
I am sure there are other instances too

Tim,

You might just want to replace the whole keyboard with a new one. I got one
off eBay from myatari.com for $15. They seem to have more.

Programming for it would be exactly the same as for the original one,
poking into hardware locations where ever the extra chip is decoded in the
address space. Minus the shadow RAM addresses of course.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

K2 has released their stable production tools as freeware on
sourceforge.

The tools have been used to "create" many Award-winning Demos, like
"Voyage sans Fin" or BSC.

- k2asm Assembler with support for scopes and DNC.
- k2pp Macro-Preprocessor with built-in python scripting.
- k2link Dumb Linker with DNC-Support.
- k2profiler Profile your code to gain speed-improvement or to debug.
- c64la Tool to manipulate/show loadaddresses.
- copy2d64 D64-Archve tool with ability to set interleave

I have also put a small tutorial online, take a look at it if you are
not sure if it is worth converting to k2devel for coding.

The Sources and Windows-Executables can be found at
https://sourceforge.net/projects/k2devel

Zed Yago/K2

PS: Most of the Tools might be useful for Atari-folks, too, only the
loadaddress/.org Stuff
will be problematic. Use "c64la -l 0" to get rid of the
commodore-style header.

3076. New Atari 8-bit CD software collections from DGS

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-04 12:35:22 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1094301403.29208.0@eunomia.uk.clara.net>
Source record: 14733

Hello All,

We have some new products available for the Atari 8-bit. The DGS PD Library PC CD-ROM is now
available, containing the entire DGS PD library (191 mostly double-sided disks) in ATR and DCM
format. It is being offered at an introductory price of just US$6 including shipping (surface
mail - airmail optional for US$1.50 extra). UK buyers have the option of paying in pounds (3pounds).

Also available at a special price is our Commercial CD-ROM containing Atari 8-bit products from
PPP, Rambit, and DGS, along with our AMS 96 show video in MPEG1 format. It is being offered at a special price of just US$6 including shipping (surface mail - airmail optional for US$1.50 extra). UK buyers have the option of paying in pounds (3pounds).

The PD and commercial CDs are also available as a single pack combo (on one disc) for the introductory price of just US$8.50 including shipping (surface mail - airmail optional for US$1.50 extra). UK buyers have the option of paying in pounds (4.25pounds).

You can buy now with a Credit/Debit/Charge card (through PayPal).

Please go to our website at http://www.dgs.clara.net and follow the link. More info on the CDs is available on the website.

3077. EMU> Inconstant frame rate

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-04 18:31:23 UTC
From: seagtgruff@aol.com
Message-ID: <20040904143123.19211.00000280@mb-m03.aol.com>
Source record: 14734

I'm having trouble getting a steady frame rate out of the Atari 2600 emulators. My good computer (which is a laptop) is temporarily out of commission, so I'm using an older Pentium II MMX 300MHz Windows 95B computer, DRMON17 with ATI 3D RAGE PRO, DirectX 7.0, StellaX v1.4.1, and Z26 v2.13. I used DXDIAG.EXE to override DirectX's default refresh rate and set it to 60 fps (at least, in theory, as DXDIAG still seems to report that it's using the default rate, so maybe that's the problem?), and I'm telling Stella and Z26 to run at 60 fps, but for most graphics modes I get rates that vary between something like 48 and 63 fps. Depending on the graphics modes, my monitor is running at 60Hz, 61Hz, or 70Hz, but changing DirectX and the emulators to run at *any* frame rate fails to give a constant result.

This is okay for basic game play, except I'm starting to get into Atari 2600 game design, and one of the tricks I want to use is page-flipping to mix colors together to produce new colors (which I've used to good effect on the Atari 800/XL/XE). For example, I'm starting out by simply exploring the capabilities and limits of each of the 2600's graphical elements-- the background, playfield, ball, two players, and two missiles-- and right now I'm working with just the background. I wrote a kernel to display 240 colors (15 luminances of 16 hues), and it looks good, although the inbetween luminances "tingle" slightly because of the inconstant frame rate. But I wrote a kernel to display 256 colors (8 luminances of 32 hues), and the tingling is much more noticeable with the inbetween hues.

I'll eventually get my laptop working again, and I presume that I won't have this frame rate problem on it, yet I was able to get the Atari800Win emulator to display a constant frame rate on this older computer, so it seems like I ought to be able to get a constant frame rate out of the StellaX and Z26 emulators. Any ideas?

Michael Rideout

You'll have a hard time to synchronize an emulator to the exact screen
rate. You know, the amount of CPU power required to do the actual
emulation differs from graphics mode to graphics mode, from what's
actually going on on the screen, from CPU power required to generate the
audio, and thus all an emulator could do is to get the framerate right
on average.

Concerning your problem with color mixing by flickering: You know, there
are emulators that emulate this "flicker-mixing" as part of the
emulation process, thus you won't need to adjust the frame rate exactly
to that of the emulator (or vice versa), you'll always get a
de-flickered image.

Greetings,
Thomas

P.S.: Atari++ is one of these emulators. (-;

Is it? For a 2nd GTIA I believe so, but for ANTIC you'll run into
trouble. It decodes itself into the $d4xx area, and it requires DMA
slots. If you put in a second Antic naively into the system, both Antic
versions would try to fetch data from RAM at the same time, causing a
mess. Thus, either the RAM must be clocked at twice the speed with the
two Antic (and the CPU) accesses interleaving (might be technically
tricky!) or two separate RAM banks would be required, with each ANTIC
only having access to one bank, and the CPU getting access to either
bank selected by some kind of port bit. Thus, I would believe that at
least the Antic programming model would rather differ.

So long,
Thomas

I did get Atari800Win to give me a flick-free screen on this computer, so I
know it's possible, although the Z26 documentation seems to suggest that I'll
need to use a faster computer and a newer Windows if I want to get the most
reliable results.

I had wondered if such a feature might be possible, but it seems to me that it
might give unpredictable and possibly undesired results at times. For one
thing, color mixing can give vastly different results depending on what kind of
display device you're using. For example, I can mix yellow and blue on a TV
screen and get a greenish color, but I might mix the same colors on a super VGA
monitor and get more of a grayish color. But if an emulator could be
programmed to use a palette that matches the actual Atari 2600 (or Atari 800)
very closely, and to mix them in a way that matches the results of using a TV
screen, composite computer monitor, etc., then it would be pretty neat! I'll
give Atari++ a try. Thanks!

Michael Rideout

3082. Loading BASIC type-ins from a cassette into an emu

Newsgroup: comp.sys.atari.8bit

From: jasonh@bcaa.bc.ca
Message-ID: <972f2471.0409052118.2e2d88b0@posting.google.com>
Source record: 14739

Hello. I'm not a regular poster to this newsgroup, but after an exhaustive search of the internet, I didn't know where else to turn. So hopefully you people can help me.

I'm trying to find out if there is a way to load my old Atari 8-Bit BASIC "type-ins" into an emulator such as Atari800Win? (With software only. No patch cables or original hardware.)

I know about WAV2CAS, and I have successfully converted a couple of my type-ins into .CAS files, but the Atari800Win emu only seems to be able to load self-executing BINARY .CAS files, not the type where you actually have to type "CLOAD" and "RUN"!

I was so excited when I found out about the prospect of an Atari tape drive emulator, then so let down when I couldn't load in all the wonderful old games I either created myself or programmed-in from magazines when I was a teen. Of course my old Atari hardware is long broken and gone, but the cassettes have been in storage and just recently rediscovered.

Thanks for your responses in advance.

PS: Is it possible to somehow convert .CAS into .ATR?

3083. atari++ 1.39

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-06 10:44:42 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <chhf2qqae1@mamenchi.zrz.TU-Berlin.DE>
Source record: 14740

Hi folks,

a new release of atari++, the C++ based atari 8 bit emulator for
Linux and Win32 is available for download at its usual location:

http://www.math.tu-berlin.de/~thor/atari++/

What's new in this release? Mainly the win32-platform will
benefit from the 1.39 as it contains an interface layer for
serial transport that allows transparent use of win32 and *ix
software. This means that features previously only available for
the Linux distribution are now also available for Win32.
Specifically:

- Emulation of the Atari 850 interface box (using a serial
port of your choice as the serial port of the interface box).

- Emulation of the Atari serial port. With a proper cable
(ProSystem or 1050-2-PC), you're now able to connect Atari
disk drives to the PC and use them within the emulator.

For that, the "SIOCable" preferences card must be setup
accordingly, and the internal drive emulation for the
corresponding internal drive emulation must be disabled.

Proper timing for userspace applications in win32 is a bit
tricky, thus I don't know how stable this link could be.
Anyhow, here we are...

So long,
Thomas

3084. Video & Monitor Standards

3085. Atari 1200XL Keyboard repair

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-06 15:29:20 UTC
From: Commander Dave <cmdr-dave@spamcop.net>
Message-ID: <bm%_c.74247$N11.46995@bignews5.bellsouth.net>
Source record: 14742

I recently acquired an Atari 1200XL system. The keyboard did not work at all, so after some searching, found the document on how to repair these keyboards (http://www.retrobits.net/keyboard.html).

Everything is going very well, and sure enough the contact 'fingers' were (how do I put this?) broken loose and not making contact... so I am looking for some of the "silver bearing paint" that is described in the document. I don't suppose that you can get this stuff at Radio Shack, eh? What are my options for purchasing it online? Anyone have a bit left over they can send me for a nominal cost?

What's bad is that I only need it for one use as I will be selling the machine as soon as it is repaired... guess I could offer the paint for free here when I am done if I can't find a use for it.

Cheers!
-Commander Dave

Command Dave,

Do a search on Froogle for Conductive Pen, it is used for making
traces on PC Boards for different purposes like repairing. I believe
this is what you are looking for.

Corey

3088. Add your classic gaming or classic computer site to 8bitclassics.com Links!

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-06 20:07:46 UTC
From: 8-Bit Classics <nospam@8bitclassics.com>
Message-ID: <lrgpj05qtmqb406s7ejfi5o557f9p0kqje@4ax.com>
Source record: 14745
Cross-posted to: comp.sys.amiga,comp.sys.apple2,comp.sys.atari.8bit,comp.sys.atari.st

Do you have a classic gaming website? Would you like to move up higher on a Google or Yahoo search? Add your website to your Links page! Simple to do, just fill out the simple form and submit your link. I will review it to make sure it fits in at 8-Bit Classics. If it does, your link should be approved soon. On the form it does mention the requirement for cross linking 8bitclassics.com on your page someplace. This isn't a requirement, just something that would be appreciated :) Just fill in your normal URL if you won't be cross linking with 8-Bit Classics.

If I get many of a certain category (like Amiga, ST, or TI), I will create a new category for them and move them.

Go to: www.8bitclassics.com and click on the Links link on the bottom.

|_____________________________________________________|

The 7th Annual Vintage Computer Festival comes at you this November
6th and 7th with the sights, sounds and smells of vintage computing!

Join us for another action packed extravaganza, featuring an exciting
lecture series, a diverse and vibrant exhibition, and a marketplace
brimming with vintage computers o' plenty!

[> Current Speaker Roster <]

Saturday, November 6

10:00AM => Fred Cohen: Using Vintage Computers in Computer Forensics
10:30AM => Jason Scott: Documenting the BBS
11:00AM => Christian Wirth: The Art of Textmode

Sunday, November 7

11:00AM => Nick Tredennick: Early Microprocessor Design
1:00PM => Andre' LaMothe: The XGameStation

* Many more speakers to be added soon; schedule subject to change

For more information on the speaker series, including abstracts and
speaker bios, visit:

[> Special Events <]
```

o Beta screening of Jason Scott's BBS Documentary

Jason Scott has been working on a series of seven films that document the history of online bulletin board systems. This will be the first public screening of these films, and the feedback from the screening audience will help direct the final cuts. More information can be found here:

http://www.vintage.org/2004/main/screening.php

o Retro-Code Video Game Programming Challenge

Can you write a videogame on a vintage computer platform in three hours or less?

http://www.vintage.org/2004/main/retrocode.php

[> Vintage Computer Exhibition <]

Vintage Computer Collectors: we want you! Exhibit your favorite computer in the Vintage Computer Exhibition. Ribbons and prizes are awarded in six classes and eight special categories, including the coveted Best of Show and People's Choice awards.

For more information on participating as an exhibitor at VCF 7.0, visit:

http://www.vintage.org/2004/main/exhibit.php

[> Vintage Computer Marketplace <]

Do you have some vintage computer items you'd like to sell? Whether you rent a booth or sell on consignment, the Vintage Computer Festival Marketplace is the premier venue for selling old computers and related items. For more information, please visit:

http://www.vintage.org/2004/main/vendor.php

[> Spread the Word! <]

Download and post this gorgeous VCF 7.0 flyer on every flat surface in your immediate and extended sphere of existence!

3092. ISO Source for Atari 822 Thermal Paper

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-07 16:53:56 UTC
From: Jason Harmon <jharmon@us.net>
Message-ID: <_4udnTC7eeU5eqDcRVn-iw@adelphia.com>
Source record: 14799

I recently restored an Atari 822 thermal printer to working condition. I have one little problem though... finding new paper rolls that fit it correctly. It appears that 4.25" paper rolls are correct, but I'm not sure what the proper outer diameter and spindle diameters are (so the roll fits on the spindle correctly).

Does anyone out there know of a manufacturer who produces new rolls of thermal paper that will correctly fit the Atari 822, and what the proper sizes for these rolls are?

Thanks.

Jason Harmon

Anyone have the Atari 1050 or Atari 800 service manual in PDF?

Pete

3094. Atari to Reissue Games and Console

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-07 23:24:37 UTC
From: Daniel Miller <NOSPAMdaclmi@sisna.com>
Message-ID: <k5gsj018opagi3b363jsk6f4m6pvmb8r3b@4ax.com>
Source record: 14801

According to the Associated Press: Atari Corp. is not only going to reissue a bunch of old games in a CD-ROM-based anthology for Playstation 2 and XBox, they are also going to manufacture a miniature version of the Atari 7800!!!

Would rather have them reissue the 800 XL or XE games machine, but this is also good.

They even refer to something called Saboteur (an unreleased 7800 game I gather). Here's an excerpt from the AP article:

Tue Sep 7, 2:06 PM ET
By ANTHONY BREZNICAN, AP Entertainment Writer

The video game company told The Associated Press on Tuesday it plans to reissue scores of its classic titles from yesteryear on a single disc that can be played on the game consoles Xbox (news - web sites) and PlayStation 2 (news - web sites).

"Atari Anthology" will feature 85 games and is scheduled to go on sale in November at a cost of about $20.

But it's only one of the nostalgia projects Atari will push into the market then. The second is Atari Flashback, a slightly miniaturized version of the old Atari 7800 from the mid-'80s. It will have 20 games built into it, including "Breakout," "Solaris," "Crystal Castles" and "Battlezone."

Flashback will sell for $45 and include a pair of old-school joysticks.

<stuff clipped>

Instead, the company is aiming at the nostalgia market.

<stuff clipped>

Besides its array of classic Atari 2600 and 7800 titles, the Atari Flashback console will include one previously unreleased game: "Saboteur."

A cart port would assume that the internals are actually based on 7800 architecture. Like the Jaks "Atari" joysticks with the games built in, this thing may not even be based on a 6502. That being said, if it is a 7800 integrated onto 1 or 2 chips, a cart port would be a nice addition.

You're right, of course.

There was a 2nd Antic upgrade discussed on AtariAge in the last year or so
that used an additional bank of 64kB of RAM. I think there is even a
prototype in the development/testing phase (IIRC). I don't know how Bob
Woolley did it with his though. The additional RAM has to be banked in
somewhere too.

We'll see which is more compatible and flexible/expandable of this
upcoming mini-7800 and the C64DTV to be released by Commodore World.

Based on the unspoken who came up with the C64DTV project, that person
is most likely a huge Atari fan. Maybe both companies unknowingly of
eachother would buy similar hardware solutions from this individual,
and then equip them to emulate the two different systems? Way cool if
this is how it happened... :-)

You might be referring to either infogrammes (who own the atari name)
or WMS who own all atari h/w rights prior to 1984 (in other words
before the ST)I'm assuming that the later has licensed it out to the
former

ATARI CORP as it stands no longer exists, as such

My guess is that these games are ports of the originals running on a completely different processor and platform. If that is the case HW licenses would be a non-issue, only SW rights would matter. I could be wrong but I would doubt any company would produce a 6502 based system when they could get an off-the-shelf 1 chip integrated platform and just port the games to it.

Of course I could be wrong, but that is what I suspect.

Perhaps a different approach will work with the X80 -- going back to a composite monitor. Has anyone found a composite monitor that gives a good (visual) display that does not overscan?

I did try a new Samsung 17" CRT that gave an absolutely beautiful display with the XEP80, but it still overscanned vertically, giving only 23-1/3 lines. However, in this case, the overscan is in the doubler, and to add insult to injury, there was space left at the top, and cut off at the bottom. :-(Looks like it would just fit if centered, but there is no adjustment to center the display. And to boot, the 40-column color display is terrible from the vertical color bars -- worst I've ever seen.

Have you thought of buying one of the used Apple II monochrome monitors off eBay? I use a 9" Apple IIc monitor with my XEP80 and it works nicely. The Apple II monochrome monitors for the IIe and IIc were typically used in 80 column mode.

Infogames bought Hasbro and changed their name to Atari, so Atari owns
Atari now.

As a sidenote: I find it interesting that people dont consider the
new Atari, the REAL ATARI, since there have been so many Atari's.
There was the original Nolan Bushnell Atari, then Warner Brothers
owned Atari, later it was sold off to the Tramiels and Midway bought
the arcade division, so Atari has been changing hands since the
beginning.

Atari was sold by Hasbro to infogrames.

Yeah, but nothing useful happened after the Tramiels sold/buggered it. I got my 800XL actually after the Tramiels bought their share I think. Didn't Warner still have a stake in Atari, up until the Jaguar came about? IIRC, Nolan sold it to Warner, who then sold 51% or more to the Tramiels. Later when the Jag flopped Warner sold the last of their shares. Tiny toon Adventures was going to be a Warner collaboration. Then the Tramiels cut Atari over to JTS, and later sold to Hasbro. Then they sold it to Infogrames, who then renamed their entire company to Atari. Whew, wipes brow.

> Have you thought of buying one of the used Apple II monochrome monitors off eBay? <

Hi Jason-
Thanks for the reply. I have looked at those, but know little about them. I presume that you can get all 80 char by 24 lines on the screen (without losing any text to overscan)? If you have it handy, what model number do you use?
Regards,
Larry

3113. Photos of 8-bit cables?

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-09 01:33:24 UTC
From: qnr <terry@timestorm.ross.com>

Source record: 14819

I was in a local thrift store today and saw a cable that I'm relatively certain was for the SIO ports on the 8-bits. Unfortunately, though I'd love one, I haven't owned a physical machine for years so I have no way of checking. Anyone know where I can find a photograph of one of the cables? If it turns out that it actually is one, then I'll buy it so that it doesn't end up in a landfill.

>before the ST)I'm assuming that the later has licensed it out to the
>former
>
>ATARI CORP as it stands no longer exists, as such

Uh, that's fairly far off.

Infogrames describes their structure this way:

"Infogrames SA comprises two main subsidiaries: 1) the U.S. based, publicly traded Atari, Inc. (Nasdaq: ATAR); and 2) Atari Europe, which represents the Company's original operations. Atari, Inc. includes the former GT Interactive; Atari, Inc. also manages Atari Interactive, Inc. (the former Hasbro Interactive) on behalf of its parent company."

The rights to "classic" Atari home game and computer intellectual properties, both hardware and software, as passed-along from the old Atari, Inc. (1972-1984) to Atari Corp. (1984-1996) to JTS (1996-1998) to Hasbro (1998-2001) to Infrogrames (2001-), are today consolodated under the entity, Atari Interactive, Inc. As the previous paragraph explains, Atari Interactive is managed by Atari, Inc., which is the U.S. subsidiary of Infogrames.

WMS only owned Atari Games, which inherited the Atari coin-op properties from the old Atari Inc in 1984, from 1996-1998. From there Atari Games went with Midway Games, which gave up on the coin-op market in 2001. Midway Games does still own the Atari name and properties for use in the coin-op market, should they want to return to that market some day.

Probably not really worth a followup posting, but people never want to
remember this part: _Atari Corp. purchased JTS_ in 1996.

Atari had some cash on hand but had otherwise downsized themselves to
oblivion, while JTS wanted a cheap way to go public and raise money. So after
Atari purchased JTS and then was made a division of the new JTS, everyone
(among the corporate execs anyway) was happy!

Does anyone recall exactly what sort of features this modification was
supposed to produce? I think it would be unlikely to double the
resolution. I'm thinking if each display was merged together, each
making up 50% of the color/luma of a display it would increase the
color depth/precision of any graphics mode -- something like how page
flipping is used to make extra colors, only this method shouldn't have
any flickering. 'Course, I'm only guessing big time.

And I think JTS also disappeared. But what happened to the Tramiels? We know what happened to Busnell(started a chain of resturants), and Warner (now part of the AOL consortium), but the Tramiels just dropped of the ends of the earth it would seem.

Pretty close guess IIRC. I think some of the modes were things like one
GTIA in 16 lum mode while the other was put in 9 color GTIA mode. =>
80x192 screen with 9 colors each with 16 lum levels.

Actually, that's not entirely true. They didn't purchase JTS. Atari Corp.
gave an extended bridge loan of $25,000,000 to Jugi Tandon Storage Inc. (JTS
Inc.) in retrun for a merger (and what is commonly viewed as a reverse
merger). The two companies merged together under the newly formed Jugi Tandon
Storage Corp. (JTS Corp.), each existing as a seperate entity (division)
under the new corporation. Executives/management from both JTS Inc. and
Atari Corp. were then put on the board of the new JTS Corp.

Source record: 14835

I recently sold an Alien Group Voicebox (the original model with the knob on the side). I tested it on my 48k Atari 400 (with b-key keyboard :-) and it worked fine, but it doesnt seem to be talking for the person who bought it. He has an 800xl and thinks a translator disk might help, but I seem to recall they did not work because of a subtle diff in the SIO port between the 400/800's and the XL/XE's am I right? Does anyone rem or can anyone shed any light on any hardware incompatibilities between the 400/800's and the XL's?

thanks

Indeed, JTS didn't last long after they sold the Atari rights. Conveniently
pulled from my FAQ:
JTS filed for Chapter 11 Bankruptcy Protection on December 11, 1998, and
then converted it to Chapter 7 (liquidation) on February 28, 1999.

At least for a while there were Tramiels on the Board at JTS (Jack? Sam? I'm
not sure.). I've heard that they retired, but I don't know when, or whether
it was in reference to all of them or just Jack. This is obviously getting
more into hearsay.

>>Inc.) in retrun for a merger (and what is commonly viewed as a reverse
>>merger). The two companies merged together under the newly formed Jugi Tandon
>>Storage Corp. (JTS Corp.), each existing as a seperate entity (division)
>>under the new corporation. Executives/management from both JTS Inc. and
>>Atari Corp. were then put on the board of the new JTS Corp.
>
>I stand corrected, thanks.

Well, now that I look over the press releases of the time, I think I'm
somewhat justified with the "purchase" slant:

"As a result of the transaction, Atari stockholders will hold approximately
60% of the outstanding shares of the new company following the merger. The
transaction is structured to qualify as a tax-free reorganization and will be
accounted for as a purchase."

Thank you. It is an Atari cable then, so I'll purchase it (and keep my
eyes open in the event the rest of the system comes in).

Hello Thomas-

I have a question or perhaps a "wish" for atari++. Is it feasible to add an 80 column E: device? In essence it would emulate the XEP80, but since the XEP80 just substitutes it's own E: device, seems like most any method of adding an 80 column E: driver should work. (But if you do add 80-column support, please don't add the XEP80's overscan! ;-)
Thanks,
Larry

Thanks for the suggestion, I'll put this onto the wish list. (-; I cannot
promise how fast this wish will make it into the release, but it's taken.
(And I agree that this makes some sense).

So long,
Thomas

Vintage Home Computers for Sale

Because I am moving to Europe, I am currently selling off my entire vintage home computer collection. All items are from my personal collection and have been professionally cleaned and restored unless otherwise specified. I have spent many hours working on my vintage computers taking them apart and cleaning every single piece of them. I have even cleaned each key of the keyboard individually.

My entire collection can be viewed at:

http://www.vintagehomecomputers.com

The photographs on the site are photos of the actual items for sale.

All items are located in Atlanta, GA and are available for local pickup or shipment anywhere in the world (except for those really heavy ones).

If you like a particular computer and would like to make a resonable offer, please e-mail me with the link to that machine and the price you are offering to pay.

I can accept PayPal, Checks and Money Orders.

Regards,

Krystian (at) hexlabs (dot) com

I recently purchased some software from a guy who threw this in as a bonus. While much appreciated, I unfortunately do not have a tape drive for my 8-bits. So, if anyone wants it, give me a yell. I have no way of knowing for sure that it works, but it's in excellent condition in its original hard case with instruction manual.

i finally got a hold of Ron Hamilton in regards to my library. In my library is BBS Express Pro (but only version 1.0 i think not sure) that I had purchased (including all disks and license) but from what Ron Hamilton tells me and from memory, a few of the install disks were or may be corrupted.

this purchase was before the bbs express pro library was passed on to you so not sure if there was a record of the license xfer or not (can't even tell you the node # at this point as I can't remember the users group that I purchased it off of and haven't looked at my disks in years but I think it was a very low #) - been 10 yrs; bought from a bbs somewhere east of the mississippi (that much i think i remember)

my question is this - is it possible to get free replacement node and free replacement disks as the license (and disks) were already bought and paid for (and xferred) ?

3150. WinTV and the XEP80

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-11 02:51:40 UTC
From: llppwhite@aol.comnsp
Message-ID: <20040910225140.06405.00000239@mb-m19.aol.com>
Source record: 14657

Here's a new twist to the XEP80 story (saga?). Instead of looking at the various line doublers and scalers, I wondered about the array of "video capture" cards and USB devices.

In this case, the device would have to recognize/accept the XEP's monochrome signal (some/many devices will not.) So I contacted the Hauppauge tech support and they replied that their devices will support a true monochrome signal, and the PCI cards will display the full native signal and "compensate" for overscan. I'm not sure quite what "compensate" means. (?)

Hey! Maybe I'm onto something here! Has anyone tried the XEP80 with a Hauppauge (WinTV) card?
-Larry

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Message-ID: <4143d177$0$10706$2c56edd9@news.cablerocket.com>
Source record: 14661

The second ANTIC was "enabled" to the CPU with a register bit. This allowed
the system to treat the second ANTIC as its own ANTIC and program it in
normal fashion. Each ANTIC had its own memory, the second ANTIC running a
32K SRAM of its own and the "main" ANTIC using regular DRAM.

On my mod, you could do anything you wanted on the main ANTIC, which worked normally. The second ANTIC would modify only the LUMA bits of the display, with a 5th bit tacked on. (gives you 32 shades of grey) So, you could do the 16 colors on one and 16 shades on the other. Or, you could make cute little text screens with different color text and such.

Hey! That is a *GOOD* idea! I have an ATI TV Wonder card that I have never
used.Might try installing that puppy and use it as the mono monitor
for the Atari.

3158. XEP80 Display Resolution

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-12 15:38:52 UTC
From: llppwhite@aol.comnsp
Message-ID: <20040912113852.11669.00000515@mb-m15.aol.com>
Source record: 14665

I have not been able to find any definitive data as to the actual screen display resolution of the XEP80. Its "manual" shows that the output is NTSC monochrome. That *should* mean RS-170 standard for NTSC. RS-170 is defined as 485 *visible* scan lines.

The XEP80 shows that its characters are 7wide X 10 high which should translate into 560 dots wide X 250 lines high. Presumably, the 250 high must be doubled because of interlace on NTSC systems. (?)

If that's correct, then that doesn't quite explain why the XEP80 overscans vertically. Yes, the 25th (status) line should overscan, but the 24th line should display properly. But it doesn't. The 24th line is normally cut off completely or partially depending on the display device.

Or perhaps I'm looking at the wrong. Can anyone shed any light on this?

Thanks,
Larry

Yes,the president of Micromiser software has released Turboword 80
and Turbobase into the public domain as freeware,while retaining
copyright.He said to feel free to copy and distibute.

Unfortunately,I cannot find an .ATR of Turboword 80 either.

Perhaps someone can help ? :)

Now I see why nobody took me up when I offered my Magnavox Color Monitor 40
up for grabs. With all this talk about XEP80 and overscan, I figured I'd
hook it up and see what happened... Yuck! I'm missing 2 1/2 lines at the
top AND bottom of the screen! That's right, I have 19 complete lines with
a half line above and below. Guess I'll be sticking with my VGA
upscaler...

Just to correct a few misconceptions regarding h/w rights/patents

From what i'v heard and have been told/read, any piece of h/w tech. sold/designed etc b4 the tramiel takeover in 1984 is owned by WMS (as Atari coin op co-owned all of the non coin op h/w patents/rights)

Infogramme only own the use of the name ATARI for s/w only (from what I was told)

And from what I heard right up until JTS/Tramiels Atari R/Merger, Warners were already doing a deal with WMS, and that didn't just extend to selling Atari coin op to WMS, it also related to co-owning of Some non coin op h/w patents and right (post 1984) an example of this was the co-jag project

Antic or Analog magazine published an article with circuit board diagrams, instructions, and parts list for a speech synthesizer for the 8-bits. If I recall, it used a chip labelled SPOAL2 speech processor from Radio Shack (remember when Radio schack sold parts?) It used two Joystick ports to send data to the device. (So on the 800 you could use ports 3 and 4).

Did anyone else out there build one of these?

Not exactly this one, but a speech synethesisier build on my
own design. It used the same speech chip, but I connected it to
the parallel port of the 800XL instead to the joystick ports
and used a standard VIA chip to address it. I also wrote a V:
device driver for it back then.

So long,
Thomas

A good idea.

I imagine emulating one would not be too hard. Just need to know the
command set it recognizes, and have a secondary screen device which can be
attached virtually to the joystick port.

That jogged my memory. There was somebody from Arizona I think, Potter?
He did at least one utility for reading Atari disks on a PC if the right
name is important to find.

SPO256 was the part number. I can't remeber why I had one but Potter<?>
put out the call in the newsgroup for one and I gave him mine. IIRC a
few years later when he was getting out of the 8bit world I saw he had a
SPO256 box for sale so I guess he finished it.

Direct manipulation of a real (or emulated) XEP80 would have to go
through the game port, but software that only deals with the E handler
would not need that.

Bottom line - you gotta know what the XEP80 driver software sends to the
joystick port and how the device itselfs handle that. Fortunately, the
driver disk includes commented source code... :)

Just thought I'd mention that I was finally able to get a flicker-free frame rate on the z26 emulator. I don't know exactly what the problem was, but I downloaded the x26 "frontend" program, and it seems to give me much better control over the frame rate than I was getting by running z26 from the command line (even though I had tried using the various command line options to control this).

Hi Carmel-

> ... are you going thru a pc... <

Yes -- PC. I play very few games on either PC or Atari, so I use an LCD monitor for both. The Atari is connected to an ATI All-In-Wonder card. Does a beautiful job with the 40 column screen, but will not sync with the XEP80. According to ATI, they use the color burst to sync on the AIW's.

I haven't personally tried the WinTV. I was hoping that someone already has a WinTV and XEP80 and would be willing to try it. But I was impressed that Hauppauge replied very promptly saying WTV works with monochrome.

3180. XEP80 and USB Capture Devices?

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-14 11:06:45 UTC
From: llppwhite@aol.comnsp
Message-ID: <20040914070645.16860.00003284@mb-m20.aol.com>
Source record: 14687

In looking at all the video capture products, there are a lot of USB 2.0 capture devices. Many claim an NTSC resolution or 720 X 480 maximum. That *should* provide 24 lines from the XEP80. But the 25th "status line" should overscan. Also note that USB 1.X devices typically only display about 320 X 240.

Has anyone tried one of these?

-Larry

Yes, there is some useful info in the XEP80.DOC and XEP80HAN.SRC. Perhaps if someone gets interested in this, they can add a few more comments to the source code?

It is admittedly a kludge, but one of the quickest "fixes" for the XEP80 would be to patch the handler so that it scrolls the screen after 23 lines. Thus far, I haven't figured out how to do that, but admittedly, I'm no whiz at assembler. (And if I'm modifying something like this, I need really good commenting, which this doesn't have, IMO, at least).

through the game port, but software that only deals with the E handler
would not need that. <

And that's the beauty of the Atari system. For emulation, all that would be
needed is nice, clean 80-column E: device handler. I doubt that anyone would
want to spend the time necessary to emulate the XEP at the hardware level.

I've been looking through the command set documentation, and it _seems_ to
be pretty straightforward. The XEP80 driver also replaces the S: and P:
handlers, though E: is obviously my top emulation priority. I agree that a
full hardware emulation would be way more trouble than it's worth, but
(after reading the spec) I believe the decriptions of the commands sent to
the device are more than adequate to write a screen handler capable of
accepting the commands, updating the display appropriately, and returning
the correct results.

Wow. Cool. Never got as far as a device driver for the version of the
synthesizer in the magazine.

When I realized the communication throughput required was very low, I
made an assembly VBI routine for the comm and an API for assembly and
Basic that allowed you to queue up to 8 strings of phenomes to the
device. I sent it to the magazine (and still don't remember which
one), but they never published it.

I couldn't make the circuit board, so I was stuck doing a breadboard
version of the synthesizer with wires everywhere. The RFI from that
thing when it was plugged into the 800 was epic. There was static on
every TV and radio in the house (and I suspect the neighbors', too.)

The last time I plugged it in it wasn't working. I think I had fried
the chip with static electricity.

I haven't tried on a monochrome monitor, but it looks just fine into a
color VGA. I use the next step up from the maker of the cheese box for my
conversion.

I do not own a CheeseBox,but I have a Pelican Universal VGA Box
that connects the audio and composite video to the PC and sound
card and works quite well.

The colors are somewhat faded but very crisp.

I was lucky and found mine at a yardsale for $3.00 ! :)

The box lists a URL of: www.pelicanacc.com

> Hey! Maybe I'm onto something here! Has anyone tried the XEP80 with a Hauppauge (WinTV) card? <

Hey! maybe I'm *not*! Tried a PCI model WinTV today. It does display the monochrome signal, but only displays 23-1/2 lines (and 79 columns). This is a very small improvement vertically, and a small deterioration horizintally versus my XGA Theater (scaler/doubler).

I seem to remember someone on this forum showing a list of CPU and CPU manufacturers

If memory serves me right the listing neglected to mention Atari, as from 1978 until the tramiel buy out in 1984 Atari was heavy into manuf. their own versions of the MOS 6502 (namely the b and c versions)

Also Atari were the original designers of the 65816 processors b4 the sold it to WDC who bought it to market

Further more, Atari became only the second computer manuf to also manuf CPUs/MPU's (CBM beingf the first), then followed by TI and then IBM (as part of their Intel Deal)

I have AVT-3340. I wanted audio as well as XGA capabilities - but I run
the Atari in standard VGA.

This is news to me. I've never heard this before. Are you certain
this is correct?

It seems odd that Atari would develop a 16ish-bit enhanced 65xx CPU
and then not use it in anything and then Apple opted to use it in the
last model in the Apple II series. I don't recall that the various
computer makers in the 80s were on such friendly terms.

Courtesy to those who are subscribers. Even if I did an auto redirect on
the page there are those who may not or may forget to update their bookmarks
and when I finally remove the old page, they may think that the forum was
taken down when instead it was just moved.

How many lines and columns from the XEP will it display? I'm guessing 80
columns but only 23 and some fraction lines. (?)

Larry

Have you checked your local public library. In some cities (usually the main branch) the reference section will have Sam's Photofacts. These are the TV schematics. But look for the ComputerFacts. They did some for the 400/800 and 1050.

But its usually been in medium to large cities where I found these (i.e. Denver, Sacramento, Spokane).

Glenn

Then make it a manual redirect with a big message. It was bad enough
with your cross posts the first time you advertised your site, do we
have to wade through them every time you make a change?

No, but I do have a question for you:

Can the MIO handle 512 byte sectors and non-inverted data? (the MIO did
store data to it's harddrive inverted (don't ask me what that means) as far
as I know, but there might have been an upgrade?????)

Has anyone used this combination (with the XEP80 output as TTL)? Does it
display properly? e.g. 80 columns and 24 complete lines?
Thanks,
Larry

I have not, but I have used an Apple //c in 80 column mode with the
1084s monitor and it works fine. The 1084 features a monochrome
button which makes the text much sharper in 80 column composite.
The 1084 also supports all types of overscan and various display modes
and looks great with a the standard output as well.

I must apologize and correct myself... You're right, I only get about 23 lines (and only 22 of them are whole). I also have an older ATV convertor from the same company, and it apparently cannot even handle the signal - I just get a black screen. I obviously haven't used it as much through the convertor as I had thought. The screen's quite sharp, just not all there.

Dear fellow Atari programmers,

Although I've read the "Stella Programmer's Manual", it is quite
outdated, and only covers programming techniques which are used for
games like Combat or Pong. I strongly am in need for a manual (or
tutorial) that covers techniques used for developing VCS titles such
as Donkey Kong and Fast Eddie.

Thanks in advance
Navid

To my knowledge, MIO can only handle 256 byte sectors.
I know of no upgrade. And inverted.

3215. XEP-80 and TTL Mono Monitor

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-17 21:22:16 UTC
From: Jason Harmon <jharmon@us.net>
Message-ID: <F4ydnQipEKHBy9bcRVn-jQ@adelphia.com>
Source record: 14522

Given all of these threads about finding a decent mono monitor for the XEP-80, and the almost total unavailability of decent composite ones, has anyone tried the described conversion to allow the XEP-80 to use IBM type TTL monochrome monitors? Most of the other solutions tell of loosing display lines with other solutions, which to me makes the thing basically unusable.

http://www.atariarchives.org/cfn/05/11/0139.php

As far as hardware mods go, it seems quite simple from the instructions, and allows use of either composite or TTL monitors.

If anyone has done this, I'd be interested in hearing about the experience and the results, especially if you get a clear display with no loss of screen real estate.

Thanks.

-Jason Harmon

OK. I connected the XEP to a 1084SII. I don't really know what you meant
by writing "XEP80 output as TTL" but I connected it to the luminance
input and after using all the VRs to make the oversized display fit on
the screen I got full 80 columns by 24 lines visible and even without
much distortion.

Hi Jason-

> ... has anyone tried the described conversion to allow the XEP-80 to use IBM type TTL monochrome monitors? <

Yes, I did this years ago and it worked on my Mitsubishi monitor with TTL input. The XEP80 completely filled the screen with the vertical size and horizontal size adjustments at their extremes. Well, it displayed 24 complete lines, anyway -- not the 25th "status line" IIRC.

But TTL monitors are now *almost* as rare as composite. Maybe rarer, since you can still buy new composite B/W security monitors. Interestingly, a very few of these security monitors also accept TTL in addition to composite.

As long as the XEP overscans, it will be difficult to find a good, widely available solution. But I'm still looking...

Great! And thanks a bunch for taking the time to hook this up and try it!

According to its specs, the 1084 accepts TTL and Analog RGB as well as
composite. (Dare I say it -- thanks, Commodore! ;-) A mod (or two) allows
the XEP80 to output TTL as well as composite monochrome video. From what I've
read, it is easier to get an over-sized display using the TTL. And as a bonus,
TTL looks better, too.

Thanks again very much,
Larry

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

3222. Talking A.I. Eliza-clone for Atari XL/XE?

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-19 08:42:12 UTC
From: mstepansky@aol.com
Message-ID: <20040919044212.25615.00000663@mb-m17.aol.com>
Source record: 14529

Hi,

Back in my college days, I recalled a marvelous piece of talking software for Atari XL/XE computers. Probably around 1985. It is called, if I remember correctly: "Verbal Abuse"

I remember I had so much fun chatting with this strange psychiatrist, in the form of Artifical Intelligence. Similiar to Eliza on Mac. Ironically, its mean psychiatrist is Azile (spell backward).

To win this Verbal Abuse "game" (or whatever category that was), you need to use your verbal abuse, or strong language, obscene chatter box as long as you can, enough to make him go "crazy" and gives up on you.

It is a textual-based. You need to be speak in a tasteless or vulgar language. Heh heh. I thought it was funny but serious enough to make you wonder that he is actually "talking" back to you, like the real thing - but it just AI codes in your Atari computer. Cool.

Verbal Abuse, full side floppy disk I think. Does anyone have that as .ATR format for emulator (on PC)? If not, does anyone know of similiar Eliza for PC?

Mike

3226. AD: 20% off coupon first order at 8bitclassics.com!

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-20 00:05:43 UTC
From: 8-Bit Classics <nospam@8bitclassics.com>
Message-ID: <a67sk0lgt0u3qbhma8kp64o535qc937tkr@4ax.com>
Source record: 14533
Cross-posted to: comp.sys.amiga,comp.sys.apple2,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.cbm,comp.sys.ti

Instead of having a special sale, I will let you pick what you want
and save! Take 20% off of your order from 8-Bit Classics! Use coupon
NEW20 when checking out.

What is new at 8-Bit Classics? Well, I have posted more items for
different systems, and still have plenty to add. It has taken me a
little longer than I thought, but getting there. I also have some
items that I am working on that are unique.

I am still also looking for Links! I have gotten a few, and added a
few myself of sites I felt or worthy that I frequent. Check them out
and help other site owners.

Still looking for reviews of products! If you own a product and have
a few minutes, please take some time to write a review and share your
opinion with others on that particular item (good or bad). You still
need to register to write a review, but registered users will get
addiitonal emails (if they choose) about upcoming products before they
are announced, additional discount coupons, and more. I might even
get a $ off coupon for the person who writes the most reviews.

Thanks to all who has visited and purchased from 8-Bit Classics! I am
hoping to be around for years helping the classic community with their
needs.

Thanks,

http://www.8bitclassics.com

The paper in my 822 is 4.5" wide. It uses 2 spindle plugs that fit into a
7/16"
spindle hole-a single long spindle will work I'm sure. It appears that
2.25" is the maximum outside diameter for the roll. I have a large roll of
wide themal
paper I was going to cut into rolls, never did.

You might google for roll paper suppliers.

Hi, I have not been able to get my AVB to work on my XL. I am only
partway through disassembling the various assembly used by it.
I figure it must be some address that changed in the XL, with a special
purpose that locks up the machine. I will do some testing with the 800
and XL O.S.es I have to see what works. I don't think there is any
difference in the SIO ports, other than a resistor in the 1200 XL that
have to be cut/jumpered. It is possible the XL/XE have it as well...don't
remember. If so, it didn't cause a problem for most.

The 130XE definately has the resistor on the SIO port, interferes with high
speed ops.

>sold/designed etc b4 the tramiel takeover in 1984 is owned by WMS (as
>Atari coin op co-owned all of the non coin op h/w patents/rights)

I've been scouring the U.S. patents database looking for evidence of this.

I don't think the story that ALL the hardware patents went with Atari Games holds water, but I do think there ARE some hidden stories here.

These patents: 4116444, 4102532, 4054919, 4045789, 4016362, 3793483 got assigned to Atari, Inc. over 1974-1978. They each got assigned to Atari Games Corp. on Feb. 21, 1989. Then, they each got assigned again to "Atari Corp. Legal Department" on Aug 16, 1993. Tramiel's Atari Corp. was up to something in 1993! Anyone know the scoop with this? Something about the launch of the Jaguar?

Another 5 patents from Atari Inc got assigned to "Atari Holdings, Inc." on July 11, 1984 and/or March 15, 1985. Of these, 4 ended up with Atari Corp, and one is the 4116444 from above.

The most interesting of the 5 that passed through Atari Holdings Inc is D 303127. From the sketch it looks like the 2600jr. Assigned to Atari Inc 6/13/83, assigned to Atari Holdings Inc. 3/15/85.

So one obvious question is, What was Atari Holdings, Inc., and who owned it?

I also count several hardware patents that went straight from Atari Inc. to Atari Corp. (including what looks like the 400/800 computer systems).

It's more than a little challenging to figure out what many of the patents actually are, but patents should normally be about hardware.

I also found it interesting that Midway went to the trouble of updating the ownership name on all the Atari Games patents to Midway Games West, and all on June 18, 2001.

3233. Atari Repairs PAL euro systems

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-20 08:28:27 UTC
From: mathu <mathu@indigo.ie>
Message-ID: <Htw3d.31505$Z14.10267@news.indigo.ie>
Source record: 14540

Hi,
Can anybody help me??.
I have a few Atari 8-bit computers that are in need of repair(I will pay all shipping cost + time).
The list goes as follows.....
1X400
1X600XL
1X800XL
1X130XE
1X1050 drive
....
Any help??

Regards David.

3234. atari++ 1.40 ready

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-20 08:51:40 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <cim5ms$j1m$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 14541

Hi folks,

the new 1.40 release of the C++ atari 8 bit emulator for Linux and
Win32 is available for download at:

http://www.math.tu-berlin.de/~thor/atari++/

This is mainly a bug-fix release, no new features have been added
yet.

Fixed issues in the emulator:

- The random generator was broken in the win32 implementation
(the VS provided random generator is really rather poor,
providing only a 15 bit entropy source)

Fixed issues in the built-in operating system (Os++):

- Fixed the generation of the attract-mode in general.
- Fixed attract mode for the "GTIA modes plus text window"
(Graphics 9+64, 10+64, 11+64)

The source code for Os++ is separately downloadable at this
side under "ROM Sources". Note that this is not the original
Atari ROM but the emulator implementation.

So long,
Thomas

David,

I can repair your items, but shipping to the US and back would be killer for
such heavy items.

If you cant find someone closer to take a look at them, drop me an e-mail
at classics@atarimax.com.

FWIW-
I have the Voicebox, and it also only works with the original 400/800. No
translator, OS rom replacement, etc. will make it work with my XL/XE's.

But I contacted an Atari user who was selling one, and was assured that it
absolutely worked with their 800XL.

So somewhere along the way, Alien changed something to get it work with XL's.
My guess is they changed the software driver, but that's just a guess.

A friend of mine had a voicebox, though I don't remember the brand.
To be able to use it with the XL models, an external power supply was
needed - unlike for the older models. My guess therefore is that the
SIO connector cannot supply enough power for the XL models.

So long,
Thomas

Thanks, this is pretty much what I was thinking. AlienGroup made both
the Voicebox and Voicebox II BTW.

Hi,

try contecting the ABBUC "Atari Bit Byter User Club" in Germany.
www.abbuc.de
There are two guys who repair 8-bit stuff.

For floppies try: floppydoc@abbuc.de
and
for computers: Rechnerdoc@abbuc.de

You can find these addresses on the ABBUC homepage under the menue on
the right hand side: ABBUC and more -> Who is who

Regards
Frank

3246. 1050 SIO Problem?

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-22 11:33:17 UTC
From: llppwhite@aol.comnsp
Message-ID: <20040922073317.25615.00000838@mb-m17.aol.com>
Source record: 14553

When I booted my Atari (Hard Drive) this AM, I had the speaker volume turned up higher than normal, and noticed that the SIO sound was garbled (with static) -- somewhat similar to when two drives are active with the same ID number.

I only had one SIO drive active (a 1050 Happy), so I turned it off, and the garbled sound went away. Swappd out that drive with an XF551, and there was no garbled sound. Put the 1050 back in with a different cable, but the problem remained.

Has anyone run into this before -or- any ideas as to what might be the problem with the 1050?

Thanks,
Larry

Years ago I had a 1050 US Doubler with bootleg roms on it. It had to actually warm up before the garbling would go away. When you first use it, it sounds like it sputters quite a bit when it goes into high speed mode, then after awhile it was ok. Never knew what caused that.

There is a "Bill Wilkinson" who has posted in several computer-related newsgroups using different email addresses over the years. The early posts are clearly from "Atari" Bill, but I don't know if all of the posts are from the same person. For example, there is a "Bill Wilkinson" who posts in the alt.stupidity newsgroup; is he "Atari" Bill? Anyway, the most recent computer-related post was made by bwilk_97@yahoo.com in the comp.lang.python newsgroup on September 19, 2004.

I hope this helps!

The easiest way is probably to buy a NTSC 800XL, but there is no power
supply stuff in the XL itself (AFAIK), so you should be able to buy a North
American power supply and use a monitor/TV that can handle the 50Hz
frequency that your PAL 800XL is putting out.

My commodore 1084 handles 50Hz as well as 60Hz.

> My commodore 1084 handles 50Hz as well as 60Hz.

The power supply is indeed the least problem. Get a standard 5V/2A power
connector, that's it. The XL doesn't require any other voltages, and
the part is really pretty much standard.

However, other issues are harder to solve: You would need an NTSC Antic
and an NTSC PAL, and parts of the timing/oscillator circuit would have to
be replaced. For the PAL XL, the color carrier is created by an additional
oscillator that runs at 5/4th of the main frequency that would have to be
disabled (this is due to the different chroma encoding in PAL/NTSC).

Thus, I agree: The easiest way is either to find a NTSC 800XL, or to find
a PAL/dual band TV. Getting the Atari custom chips might cost as much,
as might require lots of additional work.

So long,
Thomas

the commodore amiga 1084s monitor can handle PAL, SECAM, NTSC and
almost any crazy overscan you send to it. It looks great. I wish I
had a PAL 800xl, since you can play alot of PAL games that came from
europe inthe late 80's till early 90's some of them are very
impressive.

Howdy Larry

> Has anyone used this combination (with the XEP80 output as TTL)? Does it
> display properly? e.g. 80 columns and 24 complete lines?

I'm using a 1084 (mono) with composite video (via a connector that might not be used in the US but is very common in Europe called SCART or Peritel or Euro AV. There are different versions of the 1084, mine looks like this: http://www.mathyvannisselroy.nl/pictures.htm it's the one in the middle, above the printer. The other two are Philips CM8833's.

CU Mathy van Nisselroy

3261. Atari announced the 8-bits were discontinued

Newsgroup: comp.sys.atari.8bit

Oops, sorry, I meant mono SOUND. I use the monitor in color mode (not in
mono chrome green).

> Can you tweak the controls and get the whole XEP80 display (80 X 25) on
the
> screen in your PAL versions?

YES, on the back, the left most dial IIRC is for vertical height. I have to
turn it everytime I go from XEP80 to Antic/Gtia or vice versa. But I get
all of it on screen. BTW my 1084 has this darker (greyish maybe) "ring"
around the screen. The picture isn't very clear.

CU Mathy van Nisselroy

PS I said left most, that's when you reach over or around the monitor, not
when you look at it fromthe back of the monitor!!!

Well,
if you want true (+ old!) MS DOS (version 5.x or 6.x or such) you can
also install a small boot menu that lets you choose which OS to start
right at startup. By the way: there are some old emu programs which do
not like the multi-tasking part of Win 95/98/NT/2k/ME/XP/... . But if
you already have started WIN and then go to the DOS prompt the
multitasking drivers (etc.) are still all there and the software will
still not run. Solution: While booting Windows hold down a function key
(was it F3 ??) and it will go to the MS DOS prompt immediately without
installing any multitasking stuff... (thats what I have been told; you
know, I am still working on a 486 PC with MS DOS 6.22)... -Andreas.

Windows XP has both "CMD.EXE" and "COMMAND.COM" for your command prompt.

http://www.computerhope.com/issues/ch000395.htm

http://support.microsoft.com/default.aspx?kbid=314106

http://support.microsoft.com/default.aspx?kbid=156687

http://support.microsoft.com/default.aspx?kbid=142026

Windows 2K also has "COMMAND.COM" and "CMD.EXE" *FYI*

Windows 9x only has "COMMAND.COM" and Windows NT only has "CMD.EXE

Hope this helps, let us know.

3270. XEP80 character set

Source record: 14577

I've been working in my spare time to get a XEP80 emulation hooked up.
From the documentation and the handler source code, I believe I now have
the PIA communication ironed out - now it's a matter of getting handlers in
for the command set. One task I don't look forward to is manually entering
the bitmaps for the 7x10 character set. Does anyone happen to know if
there is a way to dump the character data from the device programmatically?
I'm afraid I already know the answer and will be spending a good amount of
time filling my character array with the appropriate 1s an 0s...

thanks

Right click the executable and go into properties. Set it up the way
you want it (full screen, memory allocation etc). XP should
automatically create a .pif file with the settings chosen.

Howdy,
There is a command prompt emulator called Dosbox that works fairly well with XP if none of the previous responses help with what you are doing.. Google for DOSBOX and you should get several hits.. Also there is VDMSound that is very good at running older MSDOS software.. Pif configurations not included.
Good Luck,
RoyE

3274. Chapter 1 of Jack Tramiel book nearing completion (see excerpt inside)

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-25 05:39:20 UTC

I spent some more time this evening working on the first chapter of my twenty chapter book on Jack Tramiel and Commodore.

Here is what I have thus far. Feel free to email comments (and suggestions/corrections) to me at: dunric@yahoo.com

JACK TRAMIEL: THE STORY OF COMMODORE
By Paul Panks

Published in the United States of America.
April 2005.

* Acknowledgments *

This book would not be possible without extraordinary contributions from a wide variety of contributors from across the world. In no particular order, I offer thanks to: Chuck Peddle; Jim Butterfield; Michael S. Tomcyzck; Cameron Kaiser; Jeri Elsworth; Jim Brain; James Morgan; Michael Rattigan; Rick Balkins; Anders Carlsson; Niklas Ramsberg; Sam Gillett; Robert Bernardo; Todd Aiken; Leif Bloomquist; Ruud Baltissen; Spiro Trikaliotis; Lance Lyon; Jim Lawless; Paul Rosenzweig; Peter van Merkerk; Maciej Witkowiak; Matthew Miller; Dan Miner; Jim MacKenzie; Stephon van Egmond; Sean Fahey; Riccardo Rubini; Jeffrey Wormsley; Matthew Hudson; Russ Perry Jr.; Nick Coplin; Jerry Kurtz; Lars Haugseth; Dave Ross; Graham Prout; Jonathan Herr; Todd Elliott; Larry Gilbert.

Other individuals have contributed to this book in numerous ways, and I apologize if I neglected to mention them. They, too, have made this book what it is today. Hats off to everyone!

Paul Panks
(Commodore User since 1983)
September 22, 2004

* Chapter One *

The year is 1947. The swirling dust of the Judean Desert behind them, two lone shepherds wandered into a strange cave near Qumran. What they found inside

became legendary: seven scrolls, some dating back nearly 2,000 years to the time of Jesus of Nazareth (called The Messiah, or Christ). The scrolls came to be known as The Dead Sea Scrolls, surely in reference to the Dead Sea less than a mile away. These old, yet remarkably preserved scrolls dated anywhere from the third century B.C. to 68 A.D. [1]

Jack Tramiel spent much of 1947 escaping the past. A survivor of Auschwitz, Tramiel survived on potatoes, mushy water, bread and light soup. He survived horrors beyond imagination. His own father was killed when the Germans injected gasoline into his veins because he had grown too weak to even eat. Jack was born in 1929 in Lodz, Poland, but later immigrated to the United States in November 1947 (along with his new bride, Helen Goldgrub, also a concentration camp survivor). Helen and Jack were married in July 1947 in liberated Germany. [2]

The long road from Auschwitz survivor to head of Commodore took Tramiel through twelve different time zones, a multitude of bumps along the way and not a single hint of regret. Tramiel survived because he was forged from a cast of iron so strong no sword could ever break him. Even today, a gold and platinum sword hangs from his fireplace worth an astounding $50,000. [3]

Jack Tramiel arrived in the United States in November 1947 with little more than $10 in his pocket. For three weeks, he looked around for odd jobs before enlisting in the United States Army. The same army that helped liberate him from the horrors of Auschwitz helped foster the birth of a company Jack called Commodore. [4]

Tramiel left the Army soon after, setting up a typewriter repair shop in the Bronx. He also worked as a cab driver in order to supplement his income. When not driving cabs or repairing typewriters, Jack could often be found devising new and brilliant ways to earn even more money. Starting out poor, mixed with Jack's insatiable curiosity, spurred Tramiel to not only be the best at what he did but make lots of money doing it. [5]

Jack eventually relocated to Toronto, Canada, founding Commodore in 1954. He went public a few years later as Commodore Business Machines. But in 1965, newly founded Commodore had hit rough waters: Chairman C. Powell Morgan, Commodore's Atlantic Acceptance

Corporation partner, was publicly chastised by the Canadian Royal Commission for "defiance of all accepted business principles" and "rapacious and unprincipled manipulation". Failing to meet agreements on a $5 million dollar loan didn't endear Morgan to the Commission. However, Morgan suddenly died from leukemia, avoiding court. Afterwards, the Commission also investigated Tramiel himself, but finding nothing terribly wrong, failed to indict him. Bad publicity no doubt damaged Commodore financially, but Tramiel's bacon was saved by Canadian investor Irving Gould, who agreed to help Tramiel out in return for a position as Chairman within the fledgling company. Tramiel, grateful, agreed. [6]

Tramiel and Commodore quickly abandoned the typewriter market for something even more fledgling: electronic calculators. While calculator veterans such as Friden/Singer and Texas Instruments virtually pioneered the industry, Jack dove headlong into a business venture barely related to his former repair shop in the Bronx. Friden had been the brainchild of Carl Friden, formerly of the Swedish Match Trust in London, England. Friden eventually migrated to San Leandro, California, where he established a calculator empire eventually usurped only by Texas Instruments. [7] Friden was sold to Singer in 1964, right as they introduced the revolutionary EC-130 and EC-132 fully integrated, electronic desktop calculators (the EC-132 even had a square root function). [8]

By 1971, Commodore had produced the Commodore C110 calculator (much smaller than the Friden calculators of only 6 years before). Thanks to modern minaturization technology, calculators once large enough to fit on a desk now fit comfortably in the palm of a human adult hand. Commodore followed up the C110 with the Minuteman series, using the now familiar red LED displays (Commodore eventually switched to the more pleasing green fluorescent displays). But fierce competition from rivals -- chiefly Texas Instruments -- nearly crushed Commodore, as a series of intense price wars nearly bankrupted the company Tramiel had founded. [9]

Enter MOS Technologies and Chuck Peddle. Peddle, formerly of Motorola, was the genius behind at least two successful microprocessors, among them the 6800 and 6502. Peddle realized that the 6800 couldn't be competitive with a price of $200, and so he left Motorola to join MOS Technologies. Once there, he

conceived of the 6502, an 8-bit microprocessor that, while lacking a few features, was nevertheless very inexpensive to manufacture. [10]

Jack quietly took note of MOS Technologies, even as Commodore's debt soared and Tramiel himself wondered about the future of his company. But he was a born survivalist, moving beyond limitations and conquering his environment with utmost ambition. In a past life Tramiel may have been Oda Nobunaga, Japanese warlord from the Sengoku Period. The ultimate goal of Nobunaga was the reunification of Japan, known as tenka-fubu ("under a single sword"). But instead of destroying the monastery at Mt. Hiei, such as Nobunaga did, Tramiel in his present incarnation slowly developed a plan to pay back his competitors with a ruthless price war. [11]

By 1976, Commodore had moved manufacturing facilities to Palo Alto, California, in part to save on manufacturing costs. MOS Technologies was busy as well, having just introduced the KIM-1 Microprocessor Trainer, a single board computer for a spartan $245. What could one do with a KIM-1? Practically anything, and despite lacking a traditional computer keyboard, the KIM-1 convinced Tramiel that the 6502 microprocessor could be the brains behind personal computers. More specifically, Chuck Peddle convinced him.. [12]

In October, Jack took the next step towards reunification of his fiefdom by outstripping the competition where the profit margins (kami?) lived: manufacturing costs. By acquiring MOS Technologies for a mere $800,000, Tramiel bolstered Commodore's manufacturing abilities 200 times over. Other acquisitions included Frontier (a Los Angeles based maker of CMOS computer chips) and MDSA, a Liquid Crystal Display (LCD) manufacturer. [13]

Tramiel was essentially following the ancient Shinto religion: a polytheistic, tribe-based religion originating elsewhere. Like Shinto, Tramiel combined his "religion" of "computers for the masses, not the classes" by abdicating his authority across many different fiefs. Like Buddha, Tramiel would leave in his wake honji suijaku ("original substance manifests traces"). [14]

Not content with resting, Tramiel and Peddle unveiled the Commodore PET (Personal Electronic Transactor) at the West Coast Computer Faire in April 1977. With the

pet rock fad still churning full speed ahead, Tramiel reasoned that a $599 computer could generate considerable interest within the burgeoning home computer market. He was right, as 12,657 souls buzzed into the West Coast Computer Faire in a mere three days time (April 15-17, 1977). [15,16]

The PET was a modest success for Commodore, and a good beginning for the still youthful company. But once again, Jack was not content. Not while foreign competition threatened to overwhelm the crowded U.S. market with imported silicon pirates. Who could he bring in to stem the tide of a perceived Japanese computer invasion? Someone like Michael Tomcyzk, of course.

In 1979, Michael S. Tomcyzk was an outsider lookin in. Soon, however, he was destined to become Jack's right hand man. The author of the cult classic The Home Computer Wars worked alongside Jack during Commodore's most critical juncture (1979-1984). I was fortunate enough to interview Michael for my Commodore webpage. As Michael explained to me in a March 2000 interview:

"Ironically, when I first entered the computer industry, it was because
I was managing a small firm in San Francisco and we became a beta site for
the first Atari 800 game computer. My staff wouldn't stop playing "Star
Raiders" so I took the Atari home. Three days later I looked up and
saw a thin shaft of light streaming in through the curtains and realized
I had been up 3 nights in a row, playing that space game.

A few weeks later I quit my job, took all my savings and spent the next
six months learning everything I could about computers. I used to hang out
at Apple Computer and got to know Steve Wozniak and Mike Markula and
some of the 'technical gnomes' at Apple. Since I was basically a journalist
with an MBA (from UCLA), I used my reporting skills to do interviews with
several people in the "new" personal computer industry. My first interview
was with the inventor of the Star Raiders game (of course!), for COMPUTE!

Magazine.

After 6 months I had job offers from Apple, Atari and Commodore. Apple
had too many geniuses. Atari had no geniuses (they lost $1 billion in 5
years which proves it!). Commodore had half geniuses and half duhs." [17]

Michael's best memories of Commodore, though, involved Jack Tramiel and Commodore's foray into the color computer market. The brazen Tramiel was often ahead of the game in almost every respect, as Tomcyzk points out in the following segment:

"At that first general manager meeting I attended on my first day,
we met at an old English country estate outside of London, in April 1980.

Jack told the group that he wanted to develop a low cost color computer.
The U.S. engineers were already working on a high cost color business
computer and were deadset against the idea of a cheaper version.
Jack told everyone to discuss it and said he would return the
next day to discuss it further.

At this time Commodore was the number THREE personal computer maker
in the U.S., but number ONE in Europe. Commodore had beaten Texas
Instruments to Europe with handheld calculators in the 1970s and every-
one in Europe knew Commodore and they have VERY strong brand
loyalty there, so Commodore computers easily became number
one there.

The bottom line was this--most of the managers felt that it was too
soon to lower the cost of personal computers. We were still making
good margins, why change? When Jack returned and asked the
group again, what did they think about the idea of a low cost
color computer?, a huge debate broke out with everyone

not only talking to the group, but also debating among

each other in small groups. Actually, only a handful
of
people were in favor of this: Jack, Tony Tokai the
general
manager from Japan, Kit Spencer the general manager
from
the U.K., a Japanese engineer named Yashi
Terakura...and me.

Jack listened for awhile, then he stood up, banged his
palm on the
table to get everyone's attention and declared,
"Gentlemen, the
Japanese are coming - so we will become the Japanese."
That
silenced the group and they grudgingly accepted the
idea.

Well, the Japanese never came. We developed the VIC
partly in Japan
and partly in the U.S. We introduced the VIC as the
VIC-1001 in Japan
and showed our first prototypes at Seibu Department
Store in September
1980.

At this time, NEC had a terrific looking computer
called the NEC PC
5000 and it had function keys, 32K of memory and
retailed for around
$600 but because of the VIC's introduction in Japan,
NEC and all the
other Japanese companies never entered the home
computer market
in the U.S. By the time they were ready, we had the
Commodore 64
and by staying ahead of them, we stopped them from
moving in.

During the 1980s they tried to pool 12 companies
around an outdated
operating system called MSX but it was based on really
dated technology
(the pixels looked like little cubes) and the moment I
saw it I declared it
'MS-Dead.' " [18]

Tomcyzk also credits Tramiel with influencing his
career outlook. When asked about Jack's influence on
his career, Michael further stated,"One of the many
lessons I was taught by my mentor Jack Tramiel is to

'live in the future.' I am still doing that [today]."

In January 1981, Commodore unveiled the first color computer ever to break the $300 barrier, the Commodore VIC-20. The VIC was priced at a remarkable $299.95, had 5K of memory (expandable to 32K), and included high resolution graphics courtesy of the VIC chip (originally designed for use in high end video games). The VIC-20 was a best seller for Jack, who watched with glee as 9,000 units per day crossed the assembly line during the VIC's zenith. [19]

With the VIC selling like hotcakes, Commodore's ship kept sailing...right into Elbow Reef. Questions about reliability nearly tossed asunder the rising Abaco Galleon, almost before it reached Hope Town. [20]. Despite the continued success of the VIC-20 (one million VICs had crossed the assembly line by Christmas 1982), as well as the recent introduction of the Commodore 64 (a powerful 64K computer for a meager $595), Commodore's stock nevertheless fell a staggering $10 the following Christmas. Serious product reliability questions raised by the Wall Street Journal brought to mind the general quandry Commodore found themselves in despite a record sales year (fiscal 1983 earnings of $91.7 million on $681.2 million in sales). The respected business journal noted an alarming 30% product failure rate for Commodore's flagship 64 computer. [21]

But if Jack was worried, he didn't show it. And neither was he sweating much, even as Commodore rang in the new year with a volley of price cuts and a now legendary price war that left several competitors nearly bankrupt. It was a risky strategy, but one which paid off handsomely for Commodore. As Tramiel abandoned the practice of establishing list prices for new hardware, competitors fell by the wayside one by one. First on Jack's revenge list was Texas Instruments, formerly of the 1970's Calculator Wars. TI had a solid product (the 16-bit TI 99/4A) but a failed marketing plan (even comedian Bill Cosby didn't help matters much). Then Atari itself, still floating thanks to the runaway success of the Atari 2600 VCS video game, was nevertheless bleeding red ink, and nearly pulled out of the home computer market altogether. Even Radio Shack and Coleco, both relatively healthy in their own right, felt the Commodore Crunch, opting instead to retreat and reassess the ongoing battle front. [22]

By Christmas 1983, however, Commodore had largely righted the ship. Tramiel had Commodore sailing the high profit seas, thanks in no small part to the dramatic price war spear headed by the revolutionary Commodore 64. The machine was a tour-de-force, a compact and powerful 64K computer with music synthesizer-quality sound (courtesy of the SID chip, or Sound Interface Device) and high resolution graphics (including eight programmable sprites and 16 vibrant colors). Priced to sell at a mere $595, the 64 obliterated the competition, eventually becoming the best selling personal computer of all time (with over 20 millions units sold worldwide). [23]

But all was not well with Jack. Sighting differences between himself and chairman Irving Gould, Tramiel abruptly resigned from Commodore on January 13, 1984. As Tramiel himself put it,"Personal reasons prevent my continuing on a full-time basis with Commodore." The sudden resignation of Tramiel sparked an exodus of Commodore executives and personnel, who left the company in droves that spring. [24]

Even as Gould handed the reigns to Marshall F. Smith, the newly christened CEO of Commodore (U.S.), Tramiel was dropping anchor, biding his time before an even bigger shark waded into his vast array of nets. Sure enough, Time Warner was looking to jettison the red-ink bleeding Atari, a once mighty video game company now hemmoraging $536 million in losses. Even chain-smoking CEO James Morgan couldn't rescue Atari alone, despite having trimmed the fat (Atari moved most manufacturing overseas) and making the now infamous statement that Atari "[would] only announce new products that [could] be delivered in three months' time." [25]

Just how overly inflated was Atari's perceived value? Nintendo of Japan, of Donkey Kong fame, heavily considered selling the Famicom (a.k.a Nintendo Entertainment System, or NES) under the Atari label. But when a former Warner attorney suddenly spilled the beans to Nintendo's Minoru Arakawa that Atari didn't even have the money to purchase the Famicom, the deal abruptly fell flat, forcing Nintendo to sell the NES without Atari's help. [26]

Looks great! Just thought it might be better in the sentence in Ch1 "His
own father was killed when the
Germans injected gasoline into his veins because he
had grown too weak to even eat." to change Germans to Nazis.
Just my 2c.

"Nazis" were noone else than Germans. Thus the sentence is correct.

I built one of these. It was Antic that published the plans. I thought it was kinda cool so I made an adaptor to use it on a 486 computer. I remember reading something in an old Byte magazine for a talking clock for the Vic-20. It used the same chip, but was wired up differently since it used the user port. I always wanted to hook it up to the Atari's PBI so I could still use the joystick on my 800XL.

I share your opinion that not all Germans during WWII were Nazis, and that
some distinction would be useful. Barring some real, hard evidence to the
contrary...

I find it strange that a Pole not understand the implications of such
sweeping statements.

What?!

You've stated in the first paragraphs that Tramiel was jew.
This is a paragraph that is just way off. Jews don't believe
in past lives. Even if you do, it has nothing to do with
the story of Commodore. Way out.

> Tramiel was essentially following the ancient Shinto
> religion: a polytheistic, tribe-based religion
> originating elsewhere. Like Shinto, Tramiel combined

> traces"). [14]

Here we go again. If you can find ANY material that Tramiel was trying
to follow an ancient Japanese religion, but no this is pure
speculations. Again it has nothing to with the story of Commodore.

Sorry to be harsh, but try to concentrate on the story if you want to
make this a book.

I'm cutting back on the things in my computer closet and would like to offer
to anyone who's interested an Atari 1025 dot matrix printer.

It would be a fun project to use it with a modern machine.

This is the Atari verison of the Okidata ML-80 printer.

It's in good condition, but will need a new ribbon.

It's free - I just ask that you cover the shipping.

It was a "nazi" organization. It was also German organization, with
German authorities, German commanders, speaking German and executing
commands and following instructions issued by German government.

"Nazi" is an abbreviation which stands for "national-sozialistich"
(national-socialistic). The "nation" mentioned is undoubtfully Germans,
because the term "national-sozialistisch" itself comes from the name of
the NSDAP, the full name of which is: "National-Sozialistische Deutsche
Arbeiter Partei" = National-Socialistic Party of German Workers; AFAIK.

All this of course means that "Nazis" were Martians, and Germans were
innocent victims of these Martians.

In fact nazis were also Italians, Ukrainians and some others (not
excluding a handful of Poles). For THAT reason saying "Nazis injected"
wouldn't be correct enough. If one wants to avoid remote generalising
about German nation, it should be "German nazis injected" then.

I am afraid you are wrong. "Nazi" is in fact the term, which refers to "nationalism" and not necessarily "national socialism". In German language "nazi" are the first four letters of "nazional" (notice the letter "z"). NSDAP, Hitler-Jugend and some other German organisations were (AFAIK) in fact falling into the category of being triple German, nationalistic and national-socialistic. Yet there were "nazi" organisations in all other Axis countries and the satellites. Those fall only in the "nazi" category but not the others.

To clear this up - I do agree that saying "nazis did" gives less information than "Germans did" and is less correct then. But your argumentation is flawed.

> All this of course means that "Nazis" were Martians, and Germans were
> innocent victims of these Martians.

And this is irrelevant-and-missed sarcasm.

It was more than just members of the Nazi party who attacked and
killed in the name of Germany. Though I'm sure that barbaric
practices such as the one described were mostly done by true blue
Nazis. Anyway, I don't know why I had to say that. It was a long
time ago and people change.

While XP and other Windows NT variants can run many DOS programs, it is not DOS based like Windows 95, 98, and ME, so there is no "native" DOS mode.

If you need to run real MS-DOS, there are a few ways you may be able to do this.

1) Install real MS-DOS on another partition.
2) Use "DosBox" to emulate a DOS machine.
3) Use VMWare to run a virtual MS-DOS machine from within XP. VMWare emulates an Intel PC down to the hardware and bios level and works quite well for this. I have a Windows XP machine simultaniously hosting virtual Linux, Windows ME, and MS-DOS machines.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

Looks great, keep up the good work, ignore the "professionals" they are
mostly 35 year olds living at home or too damn lame to get a job other than
"helping" you with your work

I have nothing but support for you!

That is WAY more complicated that needed. XP/NT basically emulate a
DOS machine at least as far as the application is concerned.

Moin siverdr,

> In German language "nazi" are the first four letters of "nazional"
> (notice the letter "z").

... let me (a German, but NOT a Nazi) clear up this mess a bit:

"nazional" is NOT a German word. "National" is spelled in German just like it is in English, ie. "national". Hence your above argument is plain wrong. The term "Nazi" refers to "Nationalsozialisten" (national socialists) who were not necessarily only Germans, neither were, or are, all Germans Nazis!

In fact, since few people understand the whole thing, I would prefer Paul to keep the whole thing OUT of his writings completely because the chance of insulting a large group of people or making a (not necessarily same) large group of people misunderstand things is just about 100%. This is dangerous and makes no sense at all. So, I think it would be best if Paul either gets it right or leaves it out.

I say this not because of what Paul writes but because of the many interpretations which imply that Germans who were/are NO Nazis are labelled Nazis now because of that which, to use a euphemism, is not exactly nice.

Finally, can we stop this thread, please?

The one I was thinking of was actually called the Midland Games Library and they had a *huge* stock of games (including multiple copies) and almost all new releases - on disk, cart and cassette.

There was another one which used to advertise quite a but which I never used - Charnwood doesn't ring a bell though.

Gareth.

This means, that before the text is corrected, you first have to demonstrate, that "nazis" involved in the fact were *not* Germans. If they were Germans, the original sentence is correct, and the entire discuss is pointless.

3308. Fiddling with MOONLORD

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-26 20:52:25 UTC
From: russg <russgilb@MUNGEsbcglobal.net>
Message-ID: <d_F5d.690$Rf1.354@newssvr19.news.prodigy.com>
Source record: 14614

I've been taking care of my Mom. (She's 85, me 61). I play
Clayton Walnum's 'Moonlord'. It plays ok on atari800win
4.0, but I still prefer XLIT!, because my computer is
marginal (333 mhz) and I like the full screen and faster
speed of XLIT!. However, error 11 occured at line 1160 and
1200 (out of range). This occurs when you use phasers.
There was a statement in the two lines:
DAM=INT(PHP/N3/DIS+0.5). I figure XLIT handles the order of
precedence a little off, so I changed it to:
DAM=INT(PHP/N3/(DIS+0.5)) This causes minimum phaser to kill
an adjacent alien from 14 to 23, from 27 to 46 for two
adjacent aliens, but, with one more thing, now Moonlord
works on XLIT! The other thing is to set the rate lock at
50 mhz instead of 60. It is a little slower, but I don't
get as many strange occurances (You phaser and your atari
ship blows up instead of the alien, or you blow up both
aliens and there is an invisible alien keeps shooting at
you. Sometimes I get both aliens and there is a third
alien left, ie. a 'hidden' alien blows up, leaving one of
the two originals you intended to blow up, you get three, or
sometimes four aliens from a single melee.

Correct, except that the Waffen-SS also had a great deal of non-German
commanders. The point is that it had a lot of non-German volunteers (up
until the end in 1945). You claimed that: "'Nazis' were noone else than
Germans". What I'm saying is that there were a lot of nazis elsewhere, and
long before 1933. And there were also (volunteer) non-Germans in
Allgemeine-SS, for that matter.

> "Nazi" is an abbreviation which stands for "national-

I did actually pick up one of two things during my school- and university
years. What's your point? That "national" in NSDAP refers to the German
"nation" in this case is not very original for an extremist right-wing party
around this time.

> All this of course means that "Nazis" were Martians, and Germans
> vwere innocent victims of these Martians.

I understand that you're being ironic here, but I don't really see why or
who you think is saying that. Sure, there are nazi apologists in Germany
but there are also people claiming that the Armenian Holocaust never took
place, or that the Chinese were happy under Japanese occupation.

Anyway, if you want to continue the this conversation , then I suggest we do
so in soc.history.war.world-war-ii.

/ J

> until the end in 1945).

This is denied by noone. But:

1) it wasn't demonstrated that the ones involved in the crime described,
weren't Germans;
2) it wasn't demonstrated that the ones involved in the crime described
was Waffen-SS;
3) even if this wasn't Waffen-SS and even if the guys there weren't
actually German (which is less than probable), they anyway followed the
instructions of *German* government on what to do with Jews.

I mostly mean that this was an *institutional* crime, i.e. this wasn't
so that *some* Germans (or even nazis) *somewhere* decided that they
kill *some* Jews for *some* reason.

This was so that the German republic was governed by *some* people who
thought that *all* Germans *anywhere* should kill *all* Jews for a
defined reason. *Any* German who opposed was persecuted by law, and
possibly killed. *Few* - have been actually persecuted.

As long as you don't demonstrate clearly, that this wasn't actually
Germans, who did the stuff described, the entire discuss is pointless.

Also, your further remarks about SS are pointless, because you have not
demostrated, that this is actually SS that the author is talking about
here. However, whatever formation was this, this was undoubtfully a
formation, that had an approval of, and followed the guidelines of
German government, formed by NSDAP. Verstehen?

>>"Nazi" is an abbreviation which stands for "national-

I am not gonna be very "original". I am just to recall some very
commonly known stuff.

And I am quite surprised that you tend to call "extremist RIGHT-wing" a
party that calls itself "socialistic", and indeed has a merit for this name.

>>All this of course means that "Nazis" were Martians, and Germans
>>vwere innocent victims of these Martians.

This remark is stupid. The only reason the Nazis chose to call
themselves "socialist" was to get the support of people who voted for
the social democratic and communist parties.
```

I don't think the story stresses enough what I observed in the 80's
and 90's. Out of every other influence on the industry Jack "The
Ripper" Tramiel's business strategies were the biggest reason the home
computer market imploded. The resulting void filled by Microsoft gave
us the current blandness we enjoy in mainstream personal computers.

Jack exploited consumer stupidity preferring cheapness over functionality. He released less expandable, mostly incompatible new computers every few months -- the "strategy" at Commodore and Atari was to make consumers buy new computers to "upgrade". It wasn't until he left Commodore that they found out how horribly he screwed them. Jack transferred Commodore's wealth into warehouses of obsolete hardware that couldn't be unloaded at a flea market.

The Atari 8-bits died so fast at his hands that one would have to think he bought Atari just to do that, since he couldn't manage to kill the Ataris off when he ran Commodore. It's a good thing he couldn't get his hands on the Amiga after he bought Atari. If Jack had the the Amiga it would have died in the market years earlier than it did with Jack releasing it in twenty versions with increasing cost-reduced fabrication and progrssivly limited expandability and compatibility.

Hi, Doc.
I don't know about the chat, can't follow you.
What is the URL? The day/time? I went to the 24.128 one and it requires a
user/pass, and it seems to be a news type chat, rather than real time.
Regards,
Russg

correct. Both WIN2K and WINXP have "cmd.exe" and "command.com"

simply copy both to your root dir if needed.

For many applications, this is true. However, there are many legacy DOS apps that won't run under WinNT variants at all, specifically some that access certain BIOS and HW functions directly, or need to load DOS based drivers.

My response wasn't to say you have to do this to get DOS functionality, however if the app needs low level DOS compatibility for some reason, these are several ways to get it on an XP machine.

It might be helpful to know what type of DOS app/function is being attemped to give a clearer answer.

Just curious, but if you use the 7X10 character set, won't it "overscan" the (virtual) screen? Or can you just emulate a larger (virtual) screen? Do you know how the character set is stored in the XEP80? I would think at least a byte and a nibble per character. (?)

So far, I've been too timid to pull the roms and try to read them. I've read they are both compatible with two *different* roms (having different/incompatible pinouts).

Hi Jason. Most legacy DOS apps will work fine under 2K/XP emulation
if you configure the app right. The ones that have most trouble I
think are those that need special device drivers loaded. Windows goes
to great lengths to provide most all of the usual drivers needed, like
CD extensions, access to extended memory, DOS networking layers etc.
Still if you have an app that just have to have a particular DOS based
driver loaded, it can be a road block as you correctly point out.

I think that apps that want to directly access the hardware are
allowed by Windows the illusion that they are doing just that (even
though they aren't exactly doing that). Works too, except that
performance can be an issue if the performance of the Win machine
isn't far enough beyond the requirements of the original DOS machine.
These days, that shouldn't be an issue.

There should be a separate virtual screen for that output, just as
there is on the real thing. It is cool to have your source and
debugging in one screen, and your output on another!

This program sounds like something written in BASIC. BASIC is BASIC,
so the error is probably something inherent in the program and not
with XLIT. (Anyone who typed in program listings from various
computer magazines can identify with this.) Bugs in programs
published in magazines happened more often than you would guess.
Fixing the programs is half the fun!!!

This website (among others) explains BASIC error messages:

http://www.atarimagazines.com/hi-res/v1n1/errormessages.php

As it says, "Error Code 11: Floating point error

My high school algebra teacher had Ten Commandments of Algebra. One of
them was, Thou Shalt Not Divide by Zero! Your computer feels the same
way. It'll give you an Error Code 11 every time.

Error Code 11 also might occur if your program is using very large or
very small numbers..."

There are three divisions in the original code you posted. Chances
are, one of these values(PHP, N3, or DIS) ends up being zero or close

enough to it to cause an underflow on the next division. Without seeing more of the program it would be difficult to determine.

Did you type this in yourself or get it from someone?

3327. XEP80 and Video Capture

Newsgroup: comp.sys.atari.8bit
Date: 2004-09-28 01:45:45 UTC
From: llppwhite@aol.comnsp
Message-ID: <20040927214545.27265.00001755@mb-m03.aol.com>
Source record: 14634

Well, something worked, but with a caveat or two. As mentioned earlier, the WinTV video capture could not display all of the XEP80's overscan. In addition, it was a little "fuzzy" when displaying the XEP80 screen. But it has a scalable window, so that the display could be made as large as desired.

This weekend I tried a Pinnacle Studio AV/DV capture board. It is capable of displaying 80 X 24 from the XEP80. However, its capture software will only display a small "preview" window -- approximately 4" X 3". That definitely makes the XEP80 display unreadable. But I have Ulead's Disc Creator, and it does recognize and can use the Pinnacle capture board. Ulead can make a much larger display window -- maybe 8" X 6" (apx), and the display can be set to "green screen". Definitely legible, although still a little "fuzzy". If the display was just a little larger, it would help. and if the contrast of the letters were a little better, that would also help, also.

So -- this works, but it's not a really good solution. If I had to choose, I'd still use Omniview to write programs. Even with it's really ugly character set, it is very legible. Once a program is written, the "Cheesebox" "XGA Theater" etc. work fine, since the display and cursor can be controlled.

But wasn't Jack also one of the "driving forces" behind the Atari ST series? And, didn't the ST's keep Atari alive longer than the 8-bit Ataris would have?

This is only an my opinion, and may have no basis in fact, but I think the Atari ST was Jack Tramiel's weapon of choice to avenge himself against Irving Gould. I don't think Jack was happy about Gould kicking him out of Commodore.

Commodore might have managed to stay afloat had the Amiga been more profitable than it was. And without the competition provided by the ST, the Amiga could have been priced a little higher, giving a better profit margin.

The Atari ST was Jack Tramiel's shining sword, and he thrust it through the heart of Irving Gould.

At this point, I'm leaning towards resizing the current virtual screen -
it's pretty easy to vary depending on the output device. I've been
contemplating between that and adding a secondary screen just for the
XEP80, but I can't convince myself to do the latter for the following
reasons:

- Many people (including me) have use for running Atari800 in DOS, which
procludes a secondary screen. In order to make the emulation available
for the largest number of OSes, I'm working with Atari800/800WinPLus.

- Once the XEP80 is enabled, the primary screen is pretty much useless
anyway. However, if anyone has an example of a way to get meaningful
output on both at the same time using some custom handler, I'll certain
change my view. Anyone out there doing any cool stuff that I should
know about? How about dual XEP80s? :)

I hope to have a teaser screen to post soon. At this point, I at least
have the PIA talking to my emulated XEP80, so I'm ready to play with
displaying the output. Then it's back to handling the full command set,
timing on return bits, etc.

As for storage or the character set, I don't know. I'm also not too
eager to go tearing mine up to find out. The bitmaps are all in the
manual, but I'm not going to enjoy entering the values for all 256 (+
more with the international characters) of them! Perhaps 10 a night or
something...

Hello All,

The introductory prices for my new range of Atari 8-bit software collection CD-ROMs expire on 30th September.

Just to remind you all, you can buy the commercial collection, PD library collection, or both together.

As an extra offer, a limited quantity of the PD library collection CD-ROM is available for sale on eBay at a reduced price. Here's the link:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=8134524052

The commercial collection includes fully licensed copies of most of the PPP software, including the Quick programming language, SAM desktop system, and games, along with software from other UK suppliers. All manuals are included. This is an opportunity to own legal copies of some great software at a bargain price. For more info, and to buy now using a credit/debit card, please visit our website: http://www.dgs.clara.net

Having stuying this subject for many years I know a lot more about Nazi ideology than you do. I know my remark was impolite but it is still stupid. I understand your nationalist point of view makes even National Socialism appear left from where you stand.

One fairly significant addition to this. I ran across a piece of "freeware" called "Descaler". It is video display software for capture cards and TV cards. It is extremely versatile, although I can't get any better clarity from it than from my other software. So perhaps the "fuzzy" display is the result of the XEP80, and not the capture cards?

Hi. The program is very old. I don't remember if I typed it in and saved
it, or I got it from spudster. Wait, I remember typing it in myself. I put
the ML and FNT files that are required to be on D: into DATA statements,
just so it could be a stand alone program.
Yes, it is BASIC, with ML routines.
I believe you are correct the statement is making a divide by 0 over-run.
I haven't run the program on a real Atari for a long time.
I'm using XLIT and Atari800win Plus 4. The program runs better on
Atari800Win, I think like it is supposed to, but I prefer XLIT.
It seems odd that DAM=INT(PHP/N3/DIS+0.5) would behave differently from
DAM=INT(PHP/N3/(DIS+0.5)). This forces the DIS+0.5 to be processed first,
whereas I think without the (), it processes the statement left to right.
I'm pretty sure it is correctly typed, ANALOG had the checksum program for
all their type-ins, which would pick up almost all errors in typing.
Thanks

Don't we have to wait for someone to mention Hitler before invoking Godwin's Law?

Oh... wait! I just did! NOW this thread can die. Or at least this part of it. Part of Paul's post, and discussion that followed, had some redeeming aspects. :-)

The http://24.148.31.8/chat/ only needs a name for the id in the chat. just as the others did.
The JYBOLAC chat moved a bit, but was on the www.jrthompson.org/atari server for 3 or 4 years, I think.
The moves were posted here.
But that chat had died down to only 2 or 3 real regulars(with different interests..makes for a slow chat),
a couple of occasional visitors, and a few that pop in for a minute just to see if anyone is there.
The vast majority of regulars did not visit anymore. Many chats were empty.
The days and times have changed little..
8P Central on Wed for C64(dead), 8P Central Thursday for Atari, and 10A Sunday for Eurochat.

Rick D.

I went there a few times several months ago, but the chat died so
much that I gave up. Now I go to #c64friends on server irc.eskimo.com
every Saturday night.

Yes, you're right. Putting parenthesis in changes the order of
precedence for the math. It's not odd -- it's what the parenthesis
are supposed to do.

By putting in the parenthesis you force the last "divide by" to always
be at least 0.5, so the divide by "error" appears to go away.
However, the intent of the math is probably entirely different.

My guess from similar code I've seen is that the result of the two
divisions should produce a number less than 1.0 (0.0001 to 0.9) and
then adding 0.5 to the result should make a number that is sometimes
greater than 1. The INT operation would then reduce that result to a
simple integer -- either 1 or 0.

By adding the 0.5 to the value in the division you've thrown off the
formula. This would probably account for the bizarre behavior you
report in the "fixed" code.

Try this instead: DAM=INT(PHP/N3/(DIS+0.001)+0.5)
I don't know how the value for DIS is produced, so I have to guess
that this might behave correctly. The idea is to add just a little
something to the DIS value to insure that it will never be 0.0.
Hopefully, the division itself won't underflow. If that happens then
something else would need to be adjusted.

> I'm pretty sure it is correctly typed, ANALOG had the checksum program for
> all their type-ins, which would pick up almost all errors in typing.

2004.08.31 DGS update, Public Domain Software Collection CD-ROM
2004.08.29 trub entry info updated/fixed, with help from trub
2004.08.27 8-Bit Classics added

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
```

listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no
guarantees. Information of this nature constantly ages; therefore, the
information contained in this list is constantly updated. Please use the
latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to
send me updates that correct errors that you find. If you use this
list, please do your part in keeping it useful for everyone!

Due to posts, I did more checking on the Alien Voice Box(AVB) I have. I found that the SIO plug connects to the 12 Volt
line on the 800, and it is not (normally) connected on the XL or XE line(since they have a 5 volt DC power supply).
Meter testing showed that my XL does not have 12 volts.

If an AVB works on an XL/XE, it is probably the AVB 2 made to work with 5 volts.

I have a voltage doubler circuit that will take the 5 volts and make it 15, then feed it into a 12V regulator. It will fit inside the AVB 1 box. But I have to check the current requirements.

Alternately, a jack can be fitted in the avb to move power over to an external 12V adapter. I would think the current would be less than a 100 ma.

If there is interest in the doubler, I can easily make more. I will post info when I finish it, assuming it actaully makes the avb work and there is no other problem, i.e. software.

Rick D.

STOP!!! Before going to Auction... Experience Sales, Service and Support! Listing Lower Prices with Dealership Standards! Selling Used & New Atari Hardware, Games/ Software, Books and Accessories! Classic Atari 8 Bit and Atari ST Computers Plus Atari Jaguar Games! Come for the Savings, stay for the Service! The Rainbow ends at Bravo Sierra Computers!!! http://www.aracnet.com/~atari/catalogs.html Click Here to Save!

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auction Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

3350. ADV: Atari Survey, E-Mail & Postal Mailing List!
